

Unit 1: Programming

Unit code	D/615/1618
Unit type	Core
Unit level	4
Credit value	15

Introduction

Programming involves describing processes and procedures which are derived from algorithms. The ability to program is what sets apart a developer and an end user. Typically the role of the developer is to instruct a device (such as a computer) to carry out instructions; the instructions are known as source code and is written in a language that is converted into something the device can understand. The device executes the instructions it is given.

Algorithms help to describe the solution to a problem or task; by identifying the data and the process needed to represent the problem or task *and* the set of steps needed to produce the desired result.

Programming languages typically provide the representation of both the data and the process; they provide control constructs and data types (which can be numbers, words, and objects, and be constant or variable).

The control constructs are used to represent the steps of an algorithm in a convenient yet unambiguous fashion. Algorithms require constructs that can perform sequential processing, selection for decision-making, and iteration for repetitive control. Any programming language that provides these basic features can be used for algorithm representation.

This unit introduces students to the core concepts of programming with an introduction to algorithms and the characteristics of programming paradigms.

Among the topics included in this unit are: introduction to algorithms, procedural, object-orientated & event-driven programming, security considerations, the integrated development environment and the debugging process.

On successful completion of this unit students will be able to design and implement algorithms in a chosen language within a suitable Integrated Development Environment (IDE). This IDE will be used to develop and help track any issues with the code.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Define basic algorithms to carry out an operation and outline the process of programming an application.
- LO2. Explain the characteristics of procedural, object-orientated and event-driven programming.
- LO3. Implement basic algorithms in code using an IDE.
- LO4. Determine the debugging process and explain the importance of a coding standard.

Essential Content

LO1 **Define basic algorithms to carry out an operation and outline the process of programming an application**

Algorithm definition:

Writing algorithms to carry out an operation, e.g. Bubble sort.

The relationship between algorithms and code.

The generation process of code; the roles of the pre-processor, compiler and linker, interpreter.

LO2 **Explain the characteristics of procedural, object-orientated and event-driven programming**

Characteristics of code:

Definitions of: data types (the role of constants/variables), methods (including input/output), control structures, iteration, scope, parameter passing, classes, inheritance and events.

Key components of an IDE with a brief explanation each component.

Use of addition of advanced text editors to view code, such as Notepad++, Atom, Sublime text, etc

LO3 **Implement basic algorithms in code using an IDE**

Implementation:

Developing simple applications which implements basic algorithms covered in LO1, using the features of a suitable language and IDE. Consider possible security concerns and how these could be solved.

LO4 **Determine the debugging process and explain the importance of a coding standard**

Review and reflection:

Documentation of the debugging process in the IDE, with reference to watch lists, breakpoints and tracing.

How the debugging process can be used to help developers fix vulnerabilities, defects and bugs in their code.

What a coding standard is and its benefits when writing code.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Define basic algorithms to carry out an operation and outline the process of programming an application		D1 Evaluate the implementation of an algorithm in a suitable language and the relationship between the written algorithm and the code variant.
P1 Provide a definition of what an algorithm is and outline the process in building an application.	M1 Determine the steps taken from writing code to execution.	
LO2 Explain the characteristics of procedural, object-orientated and event-driven programming		D2 Critically evaluate the source code of an application which implements the procedural, object-orientated and event driven paradigms, in terms of the code structure and characteristics.
P2 Give explanations of what procedural, object-orientated and event-driven paradigms are; their characteristics and the relationship between them.	M2 Compare and contrast the procedural, object orientated and event driven paradigms used in given source code of an application	
LO3 Implement basic algorithms in code using an IDE		D3 Evaluate the use of an IDE for development of applications contrasted with not using an IDE.
P3 Write a program that implements an algorithm using an IDE.	M3 Use the IDE to manage the development process of the program.	
LO4 Determine the debugging process and explain the importance of a coding standard		D4 Critically evaluate why a coding standard is necessary in a team as well as for the individual.
P4 Explain the debugging process and explain the debugging facilities available in the IDE.	M4 Evaluate how the debugging process can be used to help develop more secure, robust applications.	
P5 Outline the coding standard you have used in your code.		

Recommended Resources

This unit does not specify which programme language should be used to deliver this content – this decision can be made by the tutor.

Examples of languages that are used in industry are C#, Python, Ruby, Java, but any language which will allow the student to achieve the Learning Outcomes is acceptable.

Unit level	4
Credit value	15

Introduction

Computer networks are the driving force behind the evolution of computer systems and allow users to access data, hardware and services regardless of their location. Being knowledgeable about the underlying principles of networking is of vital importance to all IT professionals. Networking is an environment that is increasingly complex and under continuous development.

Complex computer networking has connected the world by groups of small networks through internet links to support global communications. It supports access to digital information anytime, anywhere using many applications like e-mail, audio and video transmission, including the World Wide Web, and this has opened the floodgates to the availability of information.

The aim of this unit is to provide students with wider background knowledge of computer networking essentials, how they operate, protocols, standards, security considerations and the prototypes associated with a range of networking technologies.

Students will explore a range of hardware, with related software, and will configure and install these to gain knowledge of networking systems. A range of networking technologies will be explored to deliver a fundamental knowledge of Local Area Networking (LAN), Wide Area Networking (WAN) and their evolution to form large-scale networks and the protocol methodologies related to IP data networks will be explored.

On successful completion of this unit students will gain knowledge and skills to successfully install, operate and troubleshoot a small network; and the operation of IP data networks, router, switching technologies, IP routing technologies, IP services and basic troubleshooting. Supporting a range of units in the Higher National suite, this unit underpins the principles of networks for all and enables students to work towards their studies in vendor units, if applicable.

Students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Examine networking principles and their protocols.
- LO2. Explain networking devices and operations.
- LO3. Design efficient networked systems.
- LO4. Implement and diagnose networked systems.

Essential Content

LO1 Examine networking principles and their protocols

Introduction to Networks:

Impact of networks on daily lives, the basic requirements of a reliable network, employment opportunities in the networking field, network common network attacks, network trends e.g. BYOD

Role of networks:

Purpose, benefits, resource implications, communications (e.g. transmission mediums), working practice, commercial opportunity, information sharing, collaboration.

System types:

Peer-based, client-server, cloud, cluster, centralised, virtualised.

Networking standards:

Conceptual models e.g. OSI model, TCP/IP model; standards: e.g. IEEE 802.x.

Topology:

Network representation Logical e.g. Ethernet, Token Ring; physical e.g. star, ring, bus, mesh, tree, ring.

Protocols:

Purpose of protocols; adherence, routed protocols e.g. IPv4 (addressing, subnetting, VLSM), IPv6 (addressing); Global unicast, Multicast, Link local, Unique local, EUI 64, Auto configuration, ICMP, FTP, HTTP, SMTP, POP3, SSL; management of protocols for addressing.

LO2 Explain networking devices and operations

Networking devices:

Servers; hub, routers; switches; multilayer switch (including their operating systems e.g. CISCO IOS, etc), firewall, HIDS, repeaters; bridges; wireless devices; access point (wireless/wired), content filter, Load balancer, Modem, Packet shaper, VPN concentrator.

Networking software:

Client software, server software, client operating system, server operating system, Firewall.

Server type:

Web, file, database, combination, virtualisation, terminal services server.

Server selection:

Cost, purpose, operating system requirement.

Workstation:

Hardware e.g. network card, cabling; permissions; system bus; local-system architecture e.g. memory, processor, I/O devices.

LO3 **Design efficient networked systems**

Bandwidth:

Expected average load; anticipated peak load; local internet availability; cost constraints, throughput.

Users:

Quality expectations, concept of system growth.

Networking services and applications:

DHCP; static vs dynamic IP addressing, reservations, scopes, leases, options (DNS servers, Suffixes), IP helper, DHCP relay, DNS records, Dynamic DNS.

Communications:

Suited to devices, suited to users, supportive of lifestyle desires, supportive of commercial requirements, security requirements, quality of service needs.

Scalable:

Able to support device growth, able to support addition of communication devices, able to cope with bandwidth use and trend changes, protocol utilisation, addressing.

Selection of components:

Supporting infrastructure needs; supporting connectivity requirements.

LO4 **Implement and diagnose networked systems**

Devices:

Installation of communication devices, allocation of addresses, local client configuration, server configuration, server installation, security considerations.

Verification of configuration and connectivity:

Installation of internet work communication medium, ping, extended ping, traceroute, telnet, SSH.

System monitoring:

Utilisation, bandwidth needs, monitoring user productivity and security of the system.

Maintenance schedule:

Backups, upgrades, security, auditing.

Diagnose and resolve layer 1 problems:

Framing, CRC, Runts, Giants, Dropped packets, late collisions, Input/Output errors.

Policy review:

Bandwidth, resource availability.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Examine networking principles and their protocols		LO1 & 2 D1 Critically evaluate the topology protocol selected for a given scenario to demonstrate the efficient utilisation of a networking system.
P1 Discuss the benefits and constraints of different network types and standards. P2 Explain the impact of network topology, communication and bandwidth requirements.	M1 Compare common networking principles and how protocols enable the effectiveness of networked systems.	
LO2 Explain networking devices and operations		
P3 Discuss the operating principles of networking devices and server types. P4 Discuss the inter-dependence of workstation hardware with relevant networking software.	M2 Explore a range of server types and justify the selection of a server, considering a given scenario regarding cost and performance optimisation.	
LO3 Design efficient networked systems		D2 Design a maintenance schedule to support the networked system.
P5 Design a networked system to meet a given specification. P6 Test and evaluate the design to meet the requirements and analyse user feedback with the aim of improving efficiency.	M3 Install and configure network services and applications on your choice.	
LO4 Implement and diagnose networked systems		D3 Use critical reflection to evaluate own work and justify valid conclusions.
P7 Implement a networked system based on a prepared design. P8 Document and analyse test results against expected results.	M4 Recommend potential enhancements for the networked systems.

Introduction

The need to be effective as a communicator, critical thinker, analyser, team worker and interpreter is essential. Within the workplace these skills are needed on a daily basis to show proficiency in designated tasks as part of a job role. The development of academic competence, and also the continuation of life-long learning and Continuing Professional Development (CPD), is required to ensure that individuals have a valued set of interpersonal skills that can be applied to any situation or environment.

This unit provides a foundation for good practice in a variety of contexts. The ability to communicate effectively using different tools and mediums will ensure that practical, research, design, reporting and presentation tasks are undertaken professionally and in accordance with various communication conventions. In everyday life the ability to apply critical reasoning and solve problems are necessary skills to enable task resolution and facilitate effective decision-making. Working with others in a group environment academically or within the workplace is an integral part of everyday life. Therefore, understanding the dynamics of teams in terms of culture, roles and responsibilities will ensure that there is a better understanding and awareness of the importance and value of teamwork. Continuing professional development, self-improvement and working towards various goals is an area that is encouraged in the workplace through the appraisals framework. In addition, professional development extends into higher levels of learning and the need to demonstrate effective research skills and academic reporting skills is also required.

Among the topics included in this unit are: the development of communication skills and communication literacy; the use of qualitative and quantitative data to demonstrate analysis, reasoning and critical thinking; and tasks that require the integration of others within a team-based scenario and planning and problem-solving.

On successful completion of this unit students will be able to demonstrate leadership skills through the dynamics of team working, and through reflective practice be able to evaluate the contributions made as an individual and also of others. As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Demonstrate a range of interpersonal and transferable communication skills to a target audience.
- LO2 Apply critical reasoning and thinking to a range of problem-solving scenarios.
- LO3 Discuss the importance and dynamics of working within a team and the impact of team working in different environments.
- LO4 Examine the need for Continuing Professional Development (CPD) and its role within the workplace and for higher level learning.

Essential Content

LO1 **Demonstrate a range of interpersonal and transferable communication skills to a target audience**

Effective communication:

Verbal and non-verbal e.g. awareness and use of body language, openness and responsiveness, formal and informal dialogue and feedback to a range of different stakeholders; academic report writing; use of IT to enhance communication; use of source information to undertake research.

Interpersonal skills:

Soft skills e.g. personal effectiveness, working with others, use of initiative, negotiating skills, assertiveness skills and social skills.

Time management skills:

Prioritising workloads; setting objectives; using time effectively; making and keeping appointments; planning and scheduling tasks and activities.

LO2 **Apply critical reasoning and thinking to a range of problem-solving scenarios**

Specification of the problem:

Definition of the problem; analysis and clarification.

Identification of possible outcomes:

Identification and assessment of various alternative outcomes.

Tools and methods:

Use of problem-solving methods and tools.

Plan and implement:

Sources of information; solution methodologies; selection and implementation of the best corrective action e.g. timescale, stages, resources, critical path analysis.

Evaluation:

Evaluation of whether the problem was solved or not; measurement of solution against specification and desired outcomes; sustainability.

LO3 Discuss the importance and dynamics of working within a team and the impact of team working in different environments

Working with others:

Nature and dynamics of team and group work; informal and formal settings; purpose of teams and groups e.g. long-term corporate objectives/strategy; problem-solving and short-term development projects; flexibility/adaptability; team player.

Teams and team building:

Selecting team members e.g. specialist roles, skill and style/approach mixes; identification of team/work group roles; stages in team development e.g. team building, identity, loyalty, commitment to shared beliefs, team health evaluation; action planning; monitoring and feedback; coaching skills; ethics; effective leadership skills e.g. setting direction, setting standards, motivating, innovative, responsive, effective communicator, reliability, consistency.

LO4 Examine the need for Continuing Professional Development (CPD) and its role within the workplace and for higher level learning

Responsibilities:

Own responsibilities e.g. personal responsibility, direct and indirect relationships and adaptability, decision-making processes and skills, ability to learn and develop within the work role; other e.g. employment legislation, ethics, employment rights and responsibilities.

Performance objectives:

Setting and monitoring performance objectives, measurement tools for success and achievement.

Continuing Professional Development: lifelong learning, training and development, personal development, professional development.

Evidence criteria:

Production data, personnel data, judgemental data; rating methods e.g. ranking, paired comparison, checklist, management by objectives; skills audit (personal profile using appropriate self-assessment tools); evaluating self-management; personal and interpersonal skills.

Motivation and performance:

Application and appraisal of motivational theories and techniques, rewards and incentives; manager's role; self-motivational factors.

Development plan:

Current performance; future needs; opportunities and threats to career progression; aims and objectives; achievement dates; review dates; learning programme/activities; action plans; personal development plans.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Demonstrate a range of interpersonal and transferable communication skills to a target audience</p>		<p>D1 Evaluate the effectiveness and application of interpersonal skills during the design and delivery of a training event.</p>
<p>P1 Demonstrate, using different communication styles and formats, that you can effectively design and deliver a training event for a given target audience.</p> <p>P2 Demonstrate that you have used effective time management skills in planning an event.</p>	<p>M1 Design a professional schedule to support the planning of an event, to include contingencies and justifications of time allocated.</p>	
<p>LO2 Apply critical reasoning and thinking to a range of problem-solving scenarios</p>		<p>D2 Critique the process of applying critical reasoning to a given task/activity or event.</p>
<p>P3 Demonstrate the use of different problem-solving techniques in the design and delivery of an event.</p> <p>P4 Demonstrate that critical reasoning has been applied to a given solution.</p>	<p>M2 Research the use of different problem-solving techniques used in the design and delivery of an event.</p> <p>M3 Justify the use and application of a range of solution methodologies.</p>

<p>P5 Discuss the importance of team dynamics in the success and/or failure of group work.</p> <p>P6 Work within a team to achieve a defined goal.</p>	<p>M4 Analyse team dynamics, in terms of the roles group members play in a team and the effectiveness in terms of achieving shared goals.</p>	<p>D3 Provide a critical evaluation of your own role and contribution to a group scenario.</p>
<p>L04 Examine the need for Continuing Professional Development (CPD) and its role within the workplace and for higher level learning</p>		
<p>P7 Discuss the importance of CPD and its contribution to own learning.</p> <p>P8 Produce a development plan that outlines responsibilities, performance objectives and required skills, knowledge and learning for own future goals.</p>	<p>M5 Compare and contrast different motivational theories and the impact they can have on performance within the workplace.</p>	<p>D4 Evaluate a range of evidence criteria that is used as a measure for effective CPD.</p>

Unit 4: Database Design & Development

Unit code	H/615/1622
Unit type	Core
Unit level	4
Credit value	15

Introduction

Organisations depend on their databases to provide information essential for their day-to-day operations and to help them take advantage of today's rapidly growing and maturing e-commerce opportunities. An understanding of database tools and technologies is an essential skill for designing and developing systems to support them.

Database systems continue to demand more complex data structures and interfaces, as applications get increasingly sophisticated. Most organisations collect and store large volumes of data, either on their own systems or in the cloud, and this data is used not just for the operational running of their business but also mined for other more intelligent and complex applications. Databases stand as the back-end of most systems used by organisations for their operations.

Database design and development is a fundamental and highly beneficial skill for computing students to master, regardless of their specialism.

The aim of this unit is to give students opportunities to develop an understanding of the concepts and issues relating to database design and development, as well as to provide the practical skills to translate that understanding into the design and creation of complex databases.

Topics included in this unit are: examination of different design tools and techniques; examination of different development software options; considering the development features of a fully functional robust solution covering data integrity, data validation, data consistency, data security and advanced database querying facilities across multiple tables; appropriate user interfaces for databases and for other externally linked systems; creating complex reports/dashboards, testing the system against the user and system requirements; and elements of complete system documentation.

On successful completion of this unit students will be able to use appropriate tools to design and develop a relational database system for a substantial problem. They will be able to test the system to ensure it meets user and system requirements and fully document the system by providing technical and user documentation. For practical purposes, this unit covers relational databases and related tools and techniques. A brief overview of object-oriented databases will also be covered.

Students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Use an appropriate design tool to design a relational database system for a substantial problem.
- LO2. Develop a fully functional relational database system, based on an existing system design.
- LO3. Test the system against user and system requirements.
- LO4. Produce technical and user documentation.

Essential Content

LO1 **Use an appropriate design tool to design a relational database system for a substantial problem**

The role of database systems e.g. as back-end systems, in e-commerce, for data mining applications etc.

Determining user and system requirements.

Design tools and techniques for a relational database system.

Logical design for relational databases e.g. tables, data elements, data types, indexes, primary/foreign keys, entity relationship modelling, referential integrity, data normalisation to third normal form.

Designs for data integrity, data validations, data security and data controls.

User interface design.

Output designs for user requirements.

Overview of object-oriented databases and their design tools.

LO2 **Develop a fully functional relational database system, based on an existing system design**

Consideration of database and platform options for system development.

Examination of different software development options for developing the relational database system.

Implementation of the physical data model based on the logical model.

Data stores, internal storage and external storage (e.g. the cloud).

Implementation of security elements in databases.

Relational databases with controls like data validation using; input masks, drop down lists, option buttons.

User interface for requirements, functionality, reliability, consistency and performance.

Consideration of interface links with other systems e.g. internet-based applications.

Data manipulation using appropriate query tools, including complex queries to query across multiple tables, and using functions and formulae.

Database maintenance and data manipulation: inserts, updates, amendments, deletions, data backup and recovery.

System reports using report writing tools and report generators, dashboards.

LO3 Test the system against user and system requirements

Identify elements of the system that need to be tested.

Consider data that should be used to fully test the system.

Match tests against user and system requirements.

Test procedures to be used: test plans, test models e.g. white box, black box; testing documentation.

Functional and system testing and testing the robustness of the system, including help menus, pop-ups, hot-spots, data validation checks.

LO4 Produce technical and user documentation

Technical and user documentation and their contents.

The documentation can include diagrams showing movement of data through the system, and flowcharts describing how the system works. Documentation could also extend to user guides and any initial design and implementation plans.

Learning Outcomes and Assessment Criteria

Pass		Merit	Distinction
LO1 Use an appropriate design tool to design a relational database system for a substantial problem			D1 Evaluate the effectiveness of the design in relation to user and system requirements.
P1 Design a relational database system using appropriate design tools and techniques, containing at least four interrelated tables, with clear statements of user and system requirements.	M1 Produce a comprehensive design for a fully functional system which includes interface and output designs, data validations and data normalisation.		
LO2 Develop a fully functional relational database system, based on an existing system design			LO2 & 3 D2 Evaluate the effectiveness of the database solution in relation to user and system requirements, and suggest improvements.
P2 Develop the database system with evidence of user interface, output and data validations, and querying across multiple tables.	M2 Implement a fully functional database system which includes system security and database maintenance. M3 Assess whether meaningful data has been extracted through the use of query tools to produce appropriate management information.		
P3 Implement a query language into the relational database system.			
LO3 Test the system against user and system requirements			
P4 Test the system against user and system requirements.	M4 Assess the effectiveness of the testing, including an explanation of the choice of test data used.		
LO4 Produce technical and user documentation			D3 Evaluate the database in terms of improvements needed to ensure the continued effectiveness of the system.
P5 Produce technical and user documentation.	M5 Produce technical and user documentation for a fully functional system, including diagrams showing movement of data through the system, and flowcharts describing how the system works.

Credit value	15

Introduction

Security is one of the most important challenges modern organisations face. Security is about protecting organisational assets, including personnel, data, equipment and networks from attack through the use of prevention techniques in the form of vulnerability testing/security policies and detection techniques, exposing breaches in security and implementing effective responses.

The aim of this unit is to provide students with knowledge of security, associated risks and how security breaches impact on business continuity. Students will examine security measures involving access authorisation, regulation of use, implementing contingency plans and devising security policies and procedures.

This unit introduces students to the detection of threats and vulnerabilities in physical and IT security, and how to manage risks relating to organisational security.

Among the topics included in this unit are Network Security design and operational topics, including address translation, DMZ, VPN, firewalls, AV and intrusion detection systems. Remote access will be covered, as will the need for frequent vulnerability testing as part of organisational and security audit compliance.

Students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Assess risks to IT security.
- LO2 Describe IT security solutions.
- LO3 Review mechanisms to control organisational IT security.
- LO4 Manage organisational security.

Essential Content

LO1 Assess risks to IT security

IT security risks:

Risks: unauthorised use of a system; unauthorised removal or copying of data or code from a system; damage to or destruction of physical system assets and environment; damage to or destruction of data or code inside or outside the system; naturally occurring risks.

Organisational security: business continuance; backup/restoration of data; audits; testing procedures e.g. data, network, systems, operational impact of security breaches, WANs, intranets, wireless access systems.

LO2 Describe IT security solutions

IT security solution evaluation:

Network Security infrastructure: evaluation of NAT, DMZ, FWs.

Network performance: RAID, Main/Standby, Dual LAN, web server balancing.

Data security: explain asset management, image differential/incremental backups, SAN servers.

Data centre: replica data centres, virtualisation, secure transport protocol, secure MPLS routing, segment routing and remote access methods/procedures for third-party access.

Security vulnerability: logs, traces, honeypots, data mining algorithms, vulnerability testing.

LO3 Review mechanisms to control organisational IT security

Mechanisms to control organisational IT security:

Risk assessment and integrated enterprise risk management: network change management, audit control, business continuance/disaster recovery plans, potential loss of data/business, intellectual property, hardware and software; probability of occurrence e.g. disaster, theft; staff responsibilities; Data Protection Act; Computer Misuse Act; ISO 31000 standards.

Company regulations: site or system access criteria for personnel; physical security types e.g. biometrics, swipe cards, theft prevention.

LO4 **Manage organisational security**

Manage organisational security:

Organisational security: policies e.g. system access, access to internet email, access to internet browser, development/use of software, physical access and protection, 3rd party access, business continuity, responsibility matrix.

Controlling security risk assessments and compliance with security procedures and standards e.g. ISO/IEC 17799:2005 Information Technology (Security Techniques – code of practice for information security management); informing colleagues of their security responsibilities and confirming their understanding at suitable intervals; using enterprise risk management for identifying, evaluating, implementing and follow up of security risks according to ISO 31000 standards.

Security: tools e.g. user log-on profiles to limit user access to resources; online software to train and update staff; auditing tools to monitor resource access; security audits; penetration testing; ethical hacking; gathering and recording information on security; initiating suitable actions for remediation.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Assess risks to IT security		LO1 & 2 D1 Evaluate a minimum of three of physical and virtual security measures that can be employed to ensure the integrity of organisational IT security.
P1 Identify types of security risks to organisations. P2 Describe organisational security procedures.	M1 Propose a method to assess and treat IT security risks.	
LO2 Describe IT security solutions		
P3 Identify the potential impact to IT security of incorrect configuration of firewall policies and third-party VPNs. P4 Show, using an example for each, how implementing a DMZ, static IP and NAT in a network can improve Network Security.	M2 Discuss three benefits to implement network monitoring systems with supporting reasons.	
LO3 Review mechanisms to control organisational IT security		D2 Consider how IT security can be aligned with organisational policy, detailing the security impact of any misalignment.
P5 Discuss risk assessment procedures. P6 Explain data protection processes and regulations as applicable to an organisation.	M3 Summarise the ISO 31000 risk management methodology and its application in IT security. M4 Discuss possible impacts to organisational security resulting from an IT security audit.	
LO4 Manage organisational security		D3 Evaluate the suitability of the tools used in an organisational policy.
P7 Design and implement a security policy for an organisation. P8 List the main components of an organisational disaster recovery plan, justifying the reasons for inclusion.	M5 Discuss the roles of stakeholders in the organisation to implement security audit recommendations.

Unit 24: Forensics

Unit 25: Information Security Management

Unit 6: Managing a Successful Computing Project

Unit code	T/615/1625
Unit type	Core unit
Unit level	4
Credit value	15

Introduction

This unit is assessed by a Pearson-set assignment. The project brief will be set by the centre, based on a theme provided by Pearson (this will change annually). The theme and chosen project within the theme will enable students to explore and examine a relevant and current topical aspect of computing in the context of a business environment.

In order to ensure that client expectations are met in terms of requirements, deadlines and the estimated cost, the work to deliver new computer systems or services to business organisations, or to revamp the existing ones, is always organised in projects. Therefore, skilful, knowledgeable and experienced project managers have always been in demand. It is projected that 15.7 million new project management roles will be created around the world by 2020.

The aim of this unit is to offer students an opportunity to demonstrate the skills required for managing and implementing a project. They will undertake independent research and investigation for carrying out and executing a computing project which meets appropriate aims and objectives.

On successful completion of this unit students will have the confidence to engage in decision-making, problem-solving and research activities using project management skills. They will have the fundamental knowledge and skills to enable them to investigate and examine relevant computing concepts within a work-related context, determine appropriate outcomes, decisions or solutions and present evidence to various stakeholders in an acceptable and understandable format.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Establish project aims, objectives and timeframes based on the chosen theme.
- LO2 Conduct small-scale research, information gathering and data collection to generate knowledge to support the project.
- LO3 Present the project and communicate appropriate recommendations based on meaningful conclusions drawn from the evidence findings and/or analysis.
- LO4 Reflect on the value gained from conducting the project and its usefulness to support sustainable organisational performance.

Essential Content

LO1 **Establish project aims, objectives and timeframes based on the chosen theme**

Project management:

What is project management and what does it involve?

The key stages of project management.

The advantages of using project management and why it is important.

Initiation of the project and project planning phase:

Scoping a project – defining objectives, scope, purpose and deliverables to be produced.

Steps and documentation required in the initiation phase.

Developing the project plan, including planning for timescales and time management, cost, quality, change, risk and issues.

The work breakdown structure.

Use of Bar and Gantt Charts for effective planning.

LO2 **Conduct small-scale research, information gathering and data collection to generate knowledge to support the project**

Project execution phase:

Selecting appropriate methods of information gathering, data collection and material resourcing.

The distinct phases which support a coherent and logical argument.

Use of secondary research to inform a primary empirical study.

Qualitative and quantitative research methods.

Field work:

Selecting a sample of the consumer market, businesses or individuals (those who meet certain characteristics relevant to the research theme) is used to gather data (qualitative or quantitative).

Sampling approaches and techniques, including probability and non-probability sampling.

Ethics, reliability and validity:

All research should be conducted ethically – how is this achieved and reported?

Research should also be reliable (similar results achieved from a similar sample) and valid (the research should measure what it aimed to measure).

Analysing information and data:

Using data collection tools such as interviews and questionnaires.

Using analytical techniques such as trend analysis, coding or typologies.

LO3 Present the project and communicate appropriate recommendations based on meaningful conclusions drawn from the evidence findings and/or analysis

Communicating outcomes:

Consider the method (e.g. written, verbal) and the medium (e.g. report, online, presentation).

Both method and medium will be influenced by the project research and its intended audience.

Convincing arguments:

All findings/outcomes should be convincing and presented logically where the assumption is that the audience has little or no knowledge of the project process.

Developing evaluative conclusions.

Critical and objective analysis and evaluation:

Secondary and primary data should be critiqued and considered with an objective mindset.

Objectivity results in more robust evaluations where an analysis justifies a judgement.

LO4 Reflect on the value gained from conducting the project and its usefulness to support sustainable organisational performance

Reflection for learning and practice:

The difference between reflecting on performance and evaluating a project – the former considers the research process, information gathering and data collection, the latter the quality of the research argument and use of evidence.

The cycle of reflection:

To include reflection in action and reflection on action.

How to use reflection to inform future behaviour, particularly directed towards sustainable performance.

Reflective writing:

Avoiding generalisation and focusing on personal development and the research journey in a critical and objective way.

Generalisation:

Many studies result in generalised findings. Research which has its basis in a specific field such as Human Resource Management (HRM) and in a specific context should avoid generalised conclusions.

Outcomes should be specific and actionable.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Establish project aims, objectives and timeframes based on the chosen theme</p>		<p>LO1 & 2</p> <p>D1 Critically evaluate the project management process and appropriate research methodologies applied.</p>
<p>P1 Devise project aims and objectives for a chosen scenario.</p> <p>P2 Produce a project management plan that covers aspects of cost, scope, time, quality, communication, risk and resources.</p> <p>P3 Produce a work breakdown structure and a Gantt Chart to provide timeframes and stages for completion.</p>	<p>M1 Produce a comprehensive project management plan, milestone schedule and project schedule for monitoring and completing the aims and objectives of the project.</p>	
<p>LO2 Conduct small-scale research, information gathering and data collection to generate knowledge to support the project</p>		
<p>P4 Carry out small-scale research by applying qualitative and quantitative research methods appropriate for meeting project aims and objectives.</p>	<p>M2 Evaluate the accuracy and reliability of different research methods applied.</p>	

Pass	Merit	Distinction
L03 Present the project and communicate appropriate recommendations based on meaningful conclusions drawn from the evidence findings and/or analysis		
<p>P5 Analyse research and data using appropriate tools and techniques.</p> <p>P6 Communicate appropriate recommendations as a result of research and data analysis to draw valid and meaningful conclusions.</p>	M3 Evaluate the selection of appropriate tools and techniques for accuracy and authenticity to support and justify recommendations.	<p>L03</p> <p>D2 Critically evaluate the research and data analysis tools used in the project development stages..</p>
L04 Reflect on the value gained from conducting the project and its usefulness to support sustainable organisational performance		
P7 Reflect on the value of undertaking the research to meet stated objectives and own learning and performance.	M4 Evaluate the value of the project management process and use of quality research to meet stated objectives and support own learning and performance.	<p>L04</p> <p>D3 Critically evaluate how the project supports sustainable organisational performance.</p>

Additional Evidence Requirements

In addition to the above assessment criteria, students will also be required to complete a project logbook to record ideas, changes and developments as they progress and complete the project.

Unit 3: Professional Practice

Unit 13: Computing Research Project

Unit 14: Business Intelligence

Unit 34: Systems Analysis & Design

Unit 7: Strategic Information Systems

Unit code	A/615/1626
Unit type	Optional
Unit level	4
Credit value	15

Introduction

Information is the most valuable resource that an organisation possesses. The effective gathering, protection, analysis, processing and dissemination of information is vital to the success of any organisation. As globalisation and the 24-hour economy develop and increase, organisations must ensure that their information systems are reliable, efficient and able to cope with rapid change.

This unit introduces students to the importance of information to organisations. It will examine how systems can be used to support core business functions and enable organisations to be more productive and competitive within the global marketplace.

Students will be required to analyse the information needs of an organisation at different levels and within different functional areas. It is important that computing professionals are able to understand how an organisation works and how it uses information in order to be able to design, implement, maintain and manage secure information systems to support its operations.

Among the topics included in this unit are understanding organisations in terms of their information needs and the variances within different functional areas.

Examination of different information systems at the operational, tactical and strategic levels will be required, in addition to evaluating their effectiveness and role in terms of decision making and gaining competitive advantage.

On successful completion of this unit students will have an insight into the types of systems and technologies available for effective information processing. Critical analysis will also be used to examine the integrated role that each of these play in contributing to the efficiency and competitiveness of organisations.

As a result students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Analyse the information requirements of organisations.
- LO2 Discuss the types of information systems that are used within all levels of an organisation.
- LO3 Demonstrate the use of an information system to produce management information.
- LO4 Evaluate the effectiveness of strategic information systems.

Essential Content

LO1 Analyse the information requirements of organisations

Functional area information requirements:

Finance and accounts for payroll, pensions, supplier payments and invoicing etc., human resources e.g. employee records, personnel data, appraisals, CPD etc., stock control, sales, marketing, research and development, production, distribution, IT, customer service and administration.

Information needs:

How different functional areas use and process data effectively; the integration of data and information within an organisation.

Requirements analysis:

The inputs, outputs and processing activities; information distribution requirements e.g. by location, department, individual/customer.

LO2 Discuss the types of information systems that are used within all levels of an organisation

Information systems types:

Business information systems, decision support systems, management information systems, strategic/executive information systems, office information systems, transaction processing systems, expert systems, global information systems, data warehouse systems, enterprise systems, enterprise resource planning systems, integrated information systems.

Categories of information systems:

Operational, tactical and strategic information systems.

Information and data:

Definition of information and data, sources of information, information requirements and the needs for information at different levels within an organisation; storing information and its importance with regard to security, accuracy and relevance; outputs e.g. payroll, invoicing, ordering, bookings, stock control, personnel records, goods tracking, decision-making, marketing, customer service.

LO3 Demonstrate the use of an information system to produce management information

Management information:

Reports e.g. sales report, college enrolment statistics, marketing analysis (brick v click), trends in the market, competition and market share.

Gathering information:

Defining requirements; establishing sources of information; defining other factors to be considered e.g. constraints and access to information.

Selecting information:

Analysis of information in terms of validity, accuracy, currency and relevancy; identifying and rationalising meaningful information from data sets.

Uses:

Proficiency in terms of accessing quality information that can be used for decision-making, problem-solving, predictions, trending and forecasting.

LO4 Evaluate the effectiveness of strategic information systems

Models for strategic information systems:

Porters Competitive Advantage and Wiseman's Strategic Planning Process.

Competitive advantage:

How can competitive advantage be measured and attributed to the implementation of a strategic information system?

Gaining competitive advantage:

Delivering a differentiated product or service; delivering a product or service at a lower cost; specific segmentation of the market e.g. targeted marketing to specific target audiences; innovative product or service design and implementation.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Analyse the information requirements of organisations		D1 Evaluate the inputs, outputs and processing activities of a selected organisation.
P1 Discuss the information needs and requirements for the functional departments of an organisation. P2 Produce an input/output (I/O) diagram to represent the data and information requirements of a functional department.	M1 Compare and contrast different processing activities that occur within functional departments within an organisation.	
LO2 Discuss the types of information systems that are used within all levels of an organisation		D2 Differentiate between the function and purpose of information systems at different levels within an organisation.
P3 Describe the function of different information systems. P4 Discuss the information needs required at differing levels within an organisation.	M2 Analyse the effectiveness of information systems at the operational, tactical and strategic levels within an organisation.	

Pass	Merit	Distinction
<p>LO3 Demonstrate the use of an information system to produce management information</p>		<p>D3 Critique, with examples, how a given organisation can use information for effective decision-making and forecasting.</p>
<p>P5 Demonstrate the use of an information system for management reporting purposes.</p> <p>P6 Discuss the importance of an organisation having data and information that is current, valid and accurate.</p>	<p>M3 Analyse the constraints that an organisation can face when gathering data and information.</p>	
<p>LO4 Evaluate the effectiveness of strategic information systems</p>		<p>D4 Evaluate how strategic information systems can contribute to the competitiveness of organisations.</p>
<p>P7 Identify different models that can be applied to strategic information systems.</p>	<p>M4 Justify the ways in which an organisation can obtain competitive advantage within a global market.</p>

Unit 4: Database Design & Development

Unit 38: Database Management Systems

Unit 8: Computer Systems Architecture

Unit code	J/615/1628
Unit level	4
Credit value	15

Introduction

As technology develops, it is important to have a working foundation on which to build your knowledge. Despite hardware and software being constantly updated and seemingly becoming more complex, students with a solid, underpinned knowledge about computer systems architecture will not only be able to answer questions like, "How does a central processor work?", "What does an operating system do?", "How is information stored?", "What is an instruction set?" and "How do I actually connect to the internet?", but will also be able to transfer and apply their knowledge and skill to many other areas.

This unit introduces students to the foundations of computer systems architecture together with the integrated hardware and software components and subsystems that enable and allow data to be input, processed and output. The unit further explores the concepts of operating systems, hardware management and computer networks together with the practical skills needed to diagnose, troubleshoot and maintain computer systems taking the security of these systems into consideration.

Among the topics included in this unit are: CPUs, memory, input & output devices, ALU operations, program execution, operating systems (including kernel, file systems, API and system calls), hardware management, installation, firmware, device drivers, networking (including OSI and TCP/IP models), error and information gathering, fault diagnostics, security and problem resolution.

On successful completion of this unit, students will be able to explain the purpose and role of operating systems, the relationship between the subsystems embedded within a central processing unit, the core hardware and software components associated with computer operations and be able to configure the hardware and systems needed to establish a computer network together with practical diagnostic and troubleshooting techniques. As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Explain the relationships between hardware components and the subsystems used in a computer system.
- LO2 Categorise the key features and services provided by different computer operating systems and hardware.
- LO3 Use network communication technology and the associated services to connect computer systems.
- LO4 Demonstrate diagnostic and troubleshooting skills to solve hardware, software and networking related issues.

Essential Content

LO1 Explain the relationships between hardware components and the subsystems used in a computer system

Hardware components and subsystems:

Computers consist of four main subsystems (Von Neumann Architecture, Memory, CPU (Arithmetical & Logic Unit (ALU) and Control Unit), Input and output Systems).

Review Memory subsystems regarding programs and data (variable) storage (ROM, RAM, size, speed, operation and structure).

Explore Input/output systems and structure (communicating with other devices (screen, keyboard, printers, etc.), storage (Hard Disk Drives (HDD), DVD's, etc.), IO controllers & data transfer (speed, buffers, interrupts, etc.).

Discuss ALU subsystems (mathematical & logical operations, registers, bus, etc.).

Investigate how the Control Unit works (program code & language, fetch, decode, execute, halt) including an introduction to machine language instructions (reduced instruction and complex instruction sets: arithmetic, compare, branch, control, Program Counter (PC), Instruction Register (IR) and Instruction decoder.

LO2 Categorise the key features and services provided by different computer operating systems and hardware

Operating system types and hardware:

Introduce different operating systems and types (desktop & server/network, mobile, embedded systems (e.g. Windows 10, Windows Server 2012/2016, Linux, Unix, MacOS, IOS, Android, etc.).

Hardware management and connections including the hardware abstraction layer, firmware and device drivers (network cards, video cards, optical drives, magnetic disks, solid state drives, RAID, etc.).

Installing and configuring common peripheral devices (mouse, keyboard, scanners, biometrics, webcams, smartcards, motion sensor, printers, speakers, display devices, etc.).

Features and services:

Introduce Operating Systems Architecture (Kernel, File Systems, API).

Review how operating systems function and provide services (user interface, memory management (Direct Memory Access), file management).

LO3 Use network communication technology and the associated services to connect computer systems

Networking technology and services:

Network protocols HTTP, SMTP, TCP, UDP, etc.

Layers of the TCP/IP Model: Application layer, transport layer, internet layer, network access layer.

7 layer OSI Model: purpose, architecture, functionality.

Hardware and network addresses: physical/MAC addresses, forward frame using MAC address tables, address resolution protocol (ARP), logical/IP addresses.

Network devices and components: network interface cards (NIC), network cables, switches, wireless access points, routers, network services.

Connecting computer systems to a network:

Introduce topologies including physical and logical: bus, star (extended star), ring and mesh.

Establishing network connections including wired/wireless client configuration.

Security of networking systems and the importance of this.

LO4 Demonstrate diagnostic and troubleshooting skills to solve hardware, software and networking related issues.

Hardware, software & networking issues and maintenance:

Different hardware and software related problems and the implication of choices with regards to system administration, impact on users and business operations.

Explore methods of maintenance with regard to hardware and software. Diagnostic and troubleshooting skills:

Discuss information gathering methods and techniques (such as: system documents, user information, error codes, error messages, failure domain, problem history, etc.).

Consider solutions to security problems.

Analyse evidence and establish possible problem domains, complexity, priority and impact; introduce 'Research, Determine, Implement, Review, Document (and Repeat)'.

Creating and updating system documentation.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Explain the relationships between hardware components and the subsystems used in a computer system</p>		<p>LO1 & 2</p> <p>D1 Evaluate the structure and functions of an operating system including memory, processor, device, file, security, performance and error management with regards to functionality, operation and dependency.</p>
<p>P1 Identify the main subsystems of a computer and explain how they are organised and connected.</p> <p>P2 Explain the purpose of the Central Processing Unit (CPU) and include details on its operation.</p>	<p>M1 Review the operation of the CPU and assess its dependency and performance with regards to associated systems and subsystems.</p>	
<p>LO2 Categorise the key features and services provided by different computer operating systems and hardware</p>		
<p>P3 Describe a range of different operating systems including the purpose, use and hardware requirements of each.</p> <p>P4 Discuss the key features associated with the architecture of an operating system.</p>	<p>M2 Analyse the services provided by an operating system with regards to user interaction, memory management, file management and hardware support.</p>

Software Development Lifecycles

Unit code	J/615/1631
Unit level	4
Credit value	15

Introduction

The software development lifecycle is an integrated process that promotes building good quality, secure software throughout the entire development process. The aim of this unit is to provide students with the knowledge and skills needed to understand software development lifecycles and to demonstrate their knowledge by implementing a software development lifecycle with a suitable methodology.

This unit introduces students to lifecycle decision-making at different stages of the software development process. Students will examine various lifecycle models and appreciate their particular characteristics to understand which project environments they are most appropriate for. Theoretical understanding will be translated into practical skills through an actual software development lifecycle project and students will become confident in the use of particular tools and techniques relevant to a chosen methodology.

Among the topics included in this unit are iterative and sequential models of software development lifecycles and reference frameworks for initially capturing conceptual data and information through a feasibility study and requirement gathering techniques through to analysis, design and software implementation activities.

As a result students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Describe different software development lifecycles.
- LO2 Explain the importance of a feasibility study.
- LO3 Undertake a software development lifecycle.
- LO4 Discuss the suitability of software behavioural design techniques.

Essential Content

LO1 Describe different software development lifecycles

Software development lifecycles:

Lifecycle models: understanding and use of predictive (Waterfall, Prototyping, RAD) and adaptive (Spiral, Agile, DSDM) software development models.

Lifecycle stage and connectivity: feasibility study, analysis, design, implementation, testing, review or analysis, design, implementation, maintenance, planning; requirements traceability.

Test and integration: building test environments; developing test harnesses; black box/white box testing; incremental testing; acceptance test and integration approaches; changeover strategies, trials and Go-Live prerequisites.

LO2 Explain the importance of a feasibility study

Importance of feasibility study:

Requirement gathering techniques: e.g., interviews, observation, investigation

Key drivers: performance and efficiency; legacy systems upgrade; automation; elimination of human error.

Feasibility criteria: issues e.g. legal, social, economic, technical, timescales; organisational constraints.

Components: purpose; structure; intended audience; outcomes.

Requirements: MosCow; Functional; non-functional; user; constraints.

LO3 Undertake a software development lifecycle

Carry out software development lifecycle:

Identify requirements: stakeholders; requirements identification; requirements specification e.g. scope, inputs, outputs, processes and process descriptors; consideration of alternate solutions and security considerations; quality assurance required.

Constraints: specific to activity e.g. costs, organisational policies, legacy systems, hardware requirements.

Report documentation: structure e.g. background information, problem statements, data collection process and summary, recommendations, appendices.

Systems analysis terminology and tools: data stores and entities; data flows; process representation techniques relationships – 1:1, 1:Many (1:M) and Many:Many (M:M).

Investigation: e.g. upgrading computer systems, designing new systems.

Techniques: examples relevant to methodology chosen e.g. Context Diagrams, Data Flow Diagrams (DFDs), Entity Relationship Diagrams (ERDs); Business Systems Options (BSOs); Technical Systems Options (TSOs); quality considerations e.g. Total Quality Management (TQM).

LO4 Discuss the suitability of software behavioural design techniques

Evaluate suitability of software behavioural design techniques:

Techniques: Flowcharts; Pseudocode; Formal specification Methods; Event/State/Data Driven; Finite State Machines (extended-FSM)/FSP; problem of e-FSM state explosion; reachability analysis, safety, liveness properties; Automatic analysis and animation tools.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Describe different software development lifecycles		D1 Assess the merits of applying the Waterfall lifecycle model to a large software development project.
<p>P1 Describe two iterative and two sequential software lifecycle models.</p> <p>P2 Explain how risk is managed in these models.</p>	<p>M1 Discuss, with an example, why a particular lifecycle model is selected for a development environment.</p>	
LO2 Explain the importance of a feasibility study		D2 Assess the impact of different feasibility criteria on a software investigation.
<p>P3 Explain the purpose of a feasibility report.</p> <p>P4 Describe how technical solutions can be compared.</p>	<p>M2 Discuss the components of a feasibility report.</p>	
LO3 Undertake a software development lifecycle		D3 Evaluate the process of undertaking a systems investigation with regards to its effectiveness in improving software quality.
<p>P5 Undertake a software investigation to meet a business need.</p> <p>P6 Use appropriate software analysis tools/techniques to carry out a software investigation and create supporting documentation.</p>	<p>M3 Analyse how software requirements can be traced throughout the software lifecycle.</p> <p>M4 Discuss two approaches to improving software quality.</p>	
LO4 Discuss the suitability of software behavioural design techniques		D4 Present justifications of how data driven software can improve the reliability and effectiveness of software.
<p>P7 Discuss using examples the suitability of software behavioural design techniques.</p>	<p>M5 Analyse a range of software behavioural tools and techniques.</p> <p>M6 Differentiate between a finite state machine (FSM) and an extended-FSM, providing an application for both.</p>

Introduction

Wireless, public hotspots, mobile broadband and unlimited network connections means that accessing and using the internet to request, use and post information has never been so easy, or so important. As public, organisational and business demand increases, so does user expectation. Designers need to successfully use technology to deliver a high quality and consistent User Experiences (UX) through friendly and functional User Interfaces (UI). However, as the software and hardware evolves, so does the challenge of design.

This unit introduces students to the underpinning services required to host, manage and access a secure website before introducing and exploring the methods used by designers and developers to blend back-end technologies (server-side) with front-end technologies (client-side). To help ensure new designers are able to design and deliver a site that offers an outstanding User Experience (UX) supported by an innovative User Interface (UI) this unit also discusses the reasons, requirements, relationships, capabilities and features of the systems they will be using and gives them an opportunity to explore various tools, techniques and technologies with 'good design' principles to plan, design and review a multipage website.

Among the topics included in this unit are: domain structure, domain name systems, web protocols, database servers, development frameworks, website publishing, content management, search engine optimisation, web browsers, HTML standards, CSS and CSS pre-processing (LESS, SASS), presentation models, responsive design, integrated development environments, user requirements, interface design, user experience, branding, navigation, optimisation and validation.

On successful completion of this unit students will be able to explain server technologies and management services associated with the hosting and management of secure websites, categorise website technologies, tools and software used to develop websites, utilise website technologies, tools and techniques with good design principles to create a multipage website and create and use a Test Plan to review the performance and design of a multipage website.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Explain server technologies and management services associated with hosting and managing websites.
- LO2 Categorise website technologies, tools and software used to develop websites.
- LO3 Utilise website technologies, tools and techniques with good design principles to create a multipage website.
- LO4 Create and use a Test Plan to review the performance and design of a multipage website.

Essential Content

LO1 Explain server technologies and management services associated with hosting and managing websites

Hosting and website management:

Investigate relationships between domain names, DNS services and communication protocols used to access a website.

Overview of publishing and managing secure websites, including search engine indexing and ranking.

Different server technologies:

Differences between web server hardware, software and host operating systems.

Advantages of an integrated database system with regards to expanding website capability.

Common web development technologies and frameworks.

LO2 Categorise website technologies, tools and software used to develop websites

Website technologies:

Using front-end technologies, presentation layers and client-side programming to build a User Interface (UI) and effect User Experience (UX).

How back-end technologies, application layers and server-side programming can be used to enable personalisation and deliver dynamic content.

Tools, techniques and software used to develop websites:

Improving User Experience (UX) through Rich Internet Application (RIA) design using JavaScript and CSS frameworks and packages.

Overview of online content management systems including possible advantages and limitations with regards to design.

Using web design and development software to design and build a secure website.

LO3 Utilise website technologies, tools and techniques with good design principles to create a multipage website

Establish the client and user requirements:

Differentiate client and user requirements from behaviours.

Consider how audience and purpose could influence the look and feel of a website.

Review accessibility standards and guidelines and their possible impact on design and aesthetics.

Research and create good content combined with good design principles to create a multipage website:

Introduce and use recognised design principles, incorporating accessibility guidelines to implement an appropriately branded, multipage site.

Discuss why and how the quality of content can affect the performance of a website.

LO4 Create and use a Test Plan to review the performance and design of a multipage website

Consider factors that influence website performance:

Review how intuitive interfaces and actions, user-friendly designs, appropriate graphics, effective navigation and good quality content can help establish user trust and deliver an improved User Experience (UX).

Consider the effects of good and bad search engine optimisation (SEO) and indexing on the performance of a website.

W3C Validation (HTML and CSS) and how it influences website design and performance.

Establish a Test Plan and use it to assess the performance of a website:

Assess the impact of poorly optimised website graphics.

Research and conduct Quality Assurance (QA) and usability testing on a multipage website.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Explain server technologies and management services associated with hosting and managing websites</p>		<p>LO1 & LO2 D1 Justify the technologies, management services, tools and software chosen to realise a custom built website.</p>
<p>P1 Identify the purpose and types of DNS, including explanations on how domain names are organised and managed.</p> <p>P2 Explain the purpose and relationships between communication protocols, server hardware, operating systems and web server software with regards to designing, publishing and accessing a website.</p>	<p>M1 Evaluate the impact of common web development technologies and frameworks with regards to website design, functionality and management.</p> <p>M2 Review the influence of search engines on website performance and provide evidence-based support for improving a site's index value and rank through search engine optimisation.</p>	
<p>LO2 Categorise website technologies, tools and software used to develop websites</p>		
<p>P3 Discuss the capabilities and relationships between front-end and back-end website technologies and explain how these relate to presentation and application layers.</p> <p>P4 Discuss the differences between online website creation tools and custom built sites with regards to design flexibility, performance, functionality, User Experience (UX) and User Interface (UI).</p>	<p>M3 Evaluate a range of tools and techniques available to design and develop a custom built website.</p>	

Pass	Merit	Distinction
<p>LO3 Utilise website technologies, tools and techniques with good design principles to create a multipage website</p>		
<p>P5 Create a design document for a branded, multipage website supported with medium fidelity wireframes and a full set of client and user requirements.</p> <p>P6 Use your design document with appropriate principles, standards and guidelines to produce a branded, multipage website supported with realistic content.</p>	<p>M4 Compare and contrast the multipage website created to the design document.</p>	<p>D2 Critically evaluate the design and development process against your design document and analyse any technical challenges.</p>
<p>LO4 Create and use a Test Plan to review the performance and design of a multipage website</p>		
<p>P7 Create a suitable Test Plan identifying key performance areas and use it to review the functionality and performance of your website.</p>	<p>M5 Evaluate the Quality Assurance (QA) process and review how it was implemented during your design and development stages.</p>	<p>D3 Critically evaluate the results of your Test Plan and include a review of the overall success of your multipage website; use this evaluation to explain any areas of success and provide justified recommendations for areas that require improvement.</p>

Maths for Computing

Unit code	D/615/1635
Unit level	4
Credit value	15

Introduction

In 1837 English mathematicians Charles Babbage and Ada Lovelace collaboratively described a machine that could perform arithmetical operations and store data within memory units. This design of their 'Analytical Engine' is the first representation of modern, general-purpose computer technology. Although modern computers have advanced far beyond Babbage and Lovelace's initial proposal, they are still fundamentally relying on mathematics for their design and operation.

This unit introduces students to the mathematical principles and theory that underpin the computing curriculum. Through a series of case studies, scenarios and task-based assessments students will explore number theory within a variety of scenarios; use applicable probability theory; apply geometrical and vector methodology; and finally evaluate problems concerning differential and integral calculus.

Among the topics included in this unit are: prime number theory, sequences and series, probability theory, geometry, differential calculus and integral calculus.

On successful completion of this unit students will be able to gain confidence with the relevant mathematics needed within other computing units. As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Use applied number theory in practical computing scenarios.
- LO2 Analyse events using probability theory and probability distributions.
- LO3 Determine solutions of graphical examples using geometry and vector methods.
- LO4 Evaluate problems concerning differential and integral calculus.

Essential Content

LO1 Use applied number theory in practical computing scenarios

Number theory:

Converting between number bases (Denary, Binary, Octal, Duodecimal and Hexadecimal).

Prime numbers, Pythagorean triples and Mersenne primes.

Greatest common divisors and least common multiples.

Modular arithmetic operations.

Sequences and series:

Expressing a sequence recursively.

Arithmetic and geometric progression theory and application.

Summation of series and the sum to infinity.

LO2 Analyse events using probability theory and probability distributions

Probability theory:

Calculating conditional probability from independent trials.

Random variables and the expectation of events.

Applying probability calculations to hashing and load balancing.

Probability distributions:

Discrete probability distribution of the binomial distribution.

Continuous probability distribution of the normal (Gaussian) distribution.

LO3 Determine solutions of graphical examples using geometry and vector methods

Geometry:

Cartesian co-ordinate systems in two dimensions.

Representing lines and simple shapes using co-ordinates.

The co-ordinate system used in programming output device.

Vectors:

Introducing vector concepts.

Cartesian and polar representations of a vector.

Scaling shapes described by vector co-ordinates.

LO4 Evaluate problems concerning differential and integral calculus

Differential calculus:

Introduction to methods for differentiating mathematical functions.

The use of stationary points to determine maxima and minima.

Using differentiation to assess rate of change in a quantity.

Integral calculus:

Introducing definite and indefinite integration for known functions.

Using integration to determine the area under a curve.

Formulating models of exponential growth and decay using integration methods.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
L01 Use applied number theory in practical computing scenarios		D1 Produce a detailed written explanation of the importance of prime numbers within the field of computing.
P1 Calculate the greatest common divisor and least common multiple of a given pair of numbers. P2 Use relevant theory to sum arithmetic and geometric progressions.	M1 Identify multiplicative inverses in modular arithmetic.	
L02 Analyse events using probability theory and probability distributions		D2 Evaluate probability theory to an example involving hashing and load balancing.
P3 Deduce the conditional probability of different events occurring within independent trials. P4 Identify the expectation of an event occurring from a discrete, random variable.	M2 Calculate probabilities within both binomially distributed and normally distributed random variables.	
L03 Determine solutions of graphical examples using geometry and vector methods		D3 Construct the scaling of simple shapes that are described by vector co-ordinates.
P5 Identify simple shapes using co-ordinate geometry. P6 Determine shape parameters using appropriate vector methods.	M3 Evaluate the co-ordinate system used in programming a simple output device.	
L04 Evaluate problems concerning differential and integral calculus		D4 Justify, by further differentiation, that a value is a minimum.
P7 Determine the rate of change within an algebraic function. P8 Use integral calculus to solve practical problems involving area.	M4 Analyse maxima and minima of increasing and decreasing functions using higher order derivatives.

Data Analytics

Unit code	K/615/1637
Unit level	4
Credit value	15

Introduction

Like the physical universe, the digital universe is enormous and is doubling in size every two years. By 2020 the digital universe – the data we create and copy annually – is projected to reach 44 zettabytes or 44 trillion gigabytes.

Data is everywhere in the world. Without knowing how to interpret this data it would be difficult to understand its meaning or make use of the data to increase the productivity of an organisation. Data analytics is a range of processes that converts data into actionable insight using a range of statistical techniques. Data analytics is a relatively new term – it is an overarching term for all decision support and problem-solving techniques. Most of the time the term ‘data analytics’ and ‘business analytics’ are used interchangeably.

This unit will introduce the theoretical foundation of data analytics and a range of data analytic processes and techniques to provide hands-on experience for enhancing students’ skills.

Topics included in this unit are: data analytic terminologies, types of data analytics, data exploration and visualisation, understanding data with descriptive, predictive and prescriptive analytics.

On successful completion of this unit students will be able to understand the theoretical foundation of data analytics, data analytic processes and techniques. Moreover they will gain hands-on experience of implementing data analytic processes and techniques using a programming language such as Python, R, or a tool such as Weka, KNIME, PowerBI, Excel etc.

As a result students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Discuss the theoretical foundation of data analytics that determine decision-making processes in management or business environments.
- LO2 Apply a range of descriptive analytic techniques to convert data into actionable insight using a range of statistical techniques.
- LO3 Investigate a range of predictive analytic techniques to discover new knowledge for forecasting future events.
- LO4 Demonstrate prescriptive analytic methods for finding the best course of action for a situation.

Essential Content

LO1 **Discuss the theoretical foundation of data analytics that determine decision-making processes in management or business environments**

Data analytics terminologies:

Population, sample, categorical data, nominal data, ordinal data, continuous data, discrete data etc.

Types of data analytics:

Descriptive data analytics, predictive data analytics and prescriptive data analytics.

Exploratory data analysis (EDA):

Variable identification, univariate and bi-variate analysis, missing values treatment, etc.

Data visualisation:

Graphs, charts, plots.

LO2 **Apply a range of descriptive analytic techniques to convert data into actionable insight using a range of statistical techniques**

Descriptive statistics:

Measures of central tendency, measure of position and measures of dispersion.

Probability distribution:

Cumulate distribution, discrete distribution, continuous distribution.

Sampling and estimation:

Random sampling, systematic sampling, point estimate, interval estimate and so forth.

Statistical inferences:

Models and assumptions.

LO3 Investigate a range of predictive analytic techniques to discover new knowledge for forecasting future events

Regression analytics:

Linear regression, multiple linear regression and logistic regression.

Forecasting techniques:

Qualitative, average approach, naïve approach, time series methods, causal relationship and so forth.

LO4 Demonstrate prescriptive analytic methods for finding the best course of action for a situation

Optimisation:

Classical optimisation, linear programming techniques, nonlinear programming techniques, dynamic programming.

Decision analysis:

Models, justifiable decisions and defensible decisions.

Learning Outcomes and Assessment Criteria

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Examine appropriate research methodologies and approaches as part of the research process.
- LO2 Conduct and analyse research relevant to a computing research project.
- LO3 Communicate the outcomes of a research project to identified stakeholders.
- LO4 Reflect on the application of research methodologies and concepts.

Essential Content

LO1 **Examine appropriate research methodologies and approaches as part of the research process**

Developing a research proposition:

The importance of developing methodical and valid propositions as the foundation for a research project.

Rationale: the purpose and significance for research question or hypothesis.

The value of the philosophical position of the researcher and the chosen methods.

Use of Saunders's research onion as a guide to establishing a methodological approach.

Literature review:

Conceptualisation of the research problem or hypothesis.

The importance of positioning a research project in context of existing knowledge.

Significance and means of providing benchmarks by which data can be judged.

Qualitative, quantitative and mixed method research:

Key theoretical frameworks for research.

Advantages and limitations of qualitative and quantitative research approaches and methods.

LO2 **Conduct and analyse research relevant for a business research project**

Research as a process:

Research has distinct phases which support a coherent and logical argument. This includes using secondary research to inform a primary, empirical, study.

Selecting a sample:

The importance of gathering data and information (qualitative or quantitative) to support research analysis.

Selecting sample types and sizes that are relevant to the research.

Considering sampling approaches and techniques, including probability and non-probability sampling.

Ethics, reliability and validity:

Research should be conducted ethically. How is this achieved and reported?

Research should also be reliable (similar results would be achieved from a similar sample) and valid (the research measures what it aimed to measure).

Analysing data:

Using data collection tools such as interviews and questionnaires.

Using analytical techniques such as trend analysis, coding or typologies.

LO3 Communicate the outcomes of a research project to identified stakeholders

Stakeholders:

Who are they?

Why would they be interested in the research outcomes?

What communication method do they expect?

Communicating research outcomes:

Consideration of different methods of communicating outcomes (e.g. written word, spoken word) and the medium (e.g. report, online, presentation). The method and medium will be influenced by the research and its intended audience.

Convincing arguments:

No matter what the method/medium, all research should be convincing and presented logically where the assumption is that the audience has little or no knowledge of the research process.

The importance of developing evaluative conclusions.

LO4 **Reflect on the application of research methodologies and concepts**

Reflection for learning and practice:

Difference between reflecting on performance and evaluating a research project. The former considers the research process; the latter considers the quality of the research argument and use of evidence.

Reflection on the merits, limitations and potential pitfalls of the chosen methods.

The cycle of reflection:

To include reflection in action and reflection on action.

Considering how to use reflection to inform future behaviour and future considerations.

Reflective writing:

Avoiding generalisation and focusing on personal development and the research journey in a critical and objective way.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Examine appropriate research methodologies and approaches as part of the research process</p>		<p>LO1 & LO2</p> <p>D1 Critically evaluate research methodologies and processes in application to a computing research project to justify chosen research methods and analysis.</p>
<p>P1 Produce a research proposal that clearly defines a research question or hypothesis supported by a literature review.</p> <p>P2 Examine appropriate research methods and approaches to primary and secondary research.</p>	<p>M1 Evaluate different research approaches and methodology and make justifications for the choice of methods selected based on philosophical/theoretical frameworks.</p>	
<p>LO2 Conduct and analyse research relevant for a business research project</p>		
<p>P3 Conduct primary and secondary research using appropriate methods for a computing research project that consider costs, access and ethical issues.</p> <p>P4 Apply appropriate analytical tools, analyse research findings and data.</p>	<p>M2 Discuss merits, limitations and pitfalls of approaches to data collection and analysis.</p>	

Pass	Merit	Distinction

Unit level	5
Credit value	15

Introduction

Data and information is core to any organisation and business process. The necessity of having meaningful information is the key driver for effective decision-making and problem-solving. Business intelligence has evolved from technologies such as decision support systems (DSS) to include tools and methods associated with data mining, data integration, data quality and data warehousing in conjunction with other information management systems and applications.

This unit introduces students to a range of tools, techniques and technologies for acquiring data and processing this into meaningful information that can be used to support business functions and processes.

Within this unit students will examine the concept of business processing in terms of data capture, conversion and information output. Students will also be required to define the tools and technologies associated with business intelligence functionality. The use of a business intelligence tool/s and techniques is also required to demonstrate an understanding of a given problem. Finally, students will be expected to evaluate the impact of business intelligence for effective decision-making.

On successful completion of this unit students will be able to appreciate the importance of business intelligence in terms of optimising decision-making and performance. By exploring the tools, techniques and systems that support business intelligence students will have an awareness of the role and contribution that these technologies and methodologies have and their importance to organisations.

As a result students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Discuss business processes and the mechanisms used to support business decision-making.
- LO2 Compare the tools and technologies associated with business intelligence functionality.
- LO3 Demonstrate the use of business intelligence tools and technologies.
- LO4 Discuss the impact of business intelligence tools and technologies for effective decision-making purposes and the legal/regulatory context in which they are used.

Essential Content

LO1 **Discuss business processes and the mechanisms used to support business decision-making**

Business process model:

Data input and capture, data processing/conversion and information output, security considerations; unstructured and semi-structured data.

Tactical and operational decisions, the business process model, business intelligence functionality.

Analyse and compare the systems and technologies associated with business intelligence.

Mechanisms:

Application software, databases, which are used to collect and store intelligence.

Systems that are used to manage, analyse and display business intelligence to support the decision-making process; the importance of reliable data; impacts of reliable data in businesses.

Business processes:

Management e.g. supporting decision-making, problem-solving; operational e.g. sales, purchasing and marketing; support e.g. accounting, technical supporting processes; improving the efficiency of a business process e.g. forecasting, decision-making, predictive reasoning; automating processes e.g. print runs, salary slips etc.

LO2 **Compare the tools and technologies associated with business intelligence functionality**

Support for business decisions:

Operational tactical and strategic. Operational examples could include product positioning or pricing. Tactical decisions could include financial outlays to gain competitive advantage. Strategic business decisions could include priorities, goals setting and forecasting for the future, global diversification etc.

Business intelligence functionality:

Analysing data, decision-making, problem-solving, designing more intuitive/innovative systems.

Systems and technologies:

Information systems at an operational, tactical and strategic level. Transaction processing, management information systems, decision support systems, expert systems.

LO3 Demonstrate the use of business intelligence tools and technologies

Tools and techniques:

Descriptive and predictive analysis, predictive modelling e.g. forecasting, use of statistical models to predict and identify trends. Data mining techniques to find anomalies, cluster patterns and/or relationships between data sets. Converting data into visual information using charts, graphs, histograms and other visual mediums.

Solutions:

Supporting a business process e.g. end user requirements, systems requirement, application to automate procedures. Designing a tool, program or package that can perform a specific task to support problem-solving or decision-making at an advanced level.

Uses:

For example, designing an application to solve a specific user need or system requirement. Create an e-commerce function for a website to support a specific business process, design a program for a specific end user that will support another application or process.

Design considerations:

Addressing a user or system requirement; designing a user-friendly and functional interface; considering user engagement and interaction with the designed solution; customisation of the solution to satisfy the user and system requirements.

LO4 Discuss the impact of business intelligence tools and technologies for effective decision-making purposes and the legal/regulatory context in which they are used

Recognise the legal, social, ethical and professional issues involved in the exploitation of computer technology.

Cybersecurity management:

Understanding the personal, organisational and legal/regulatory context in which these tools could be used, the risks of such use and the constraints (such as time, finance and people) that may affect how cybersecurity is implemented.

Evaluation criteria:

Enhanced or improved operations e.g. more efficient, faster results, more user-friendly, higher productivity, extended target audience, more competitive, more profitable, improved customer service.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Discuss business processes and the mechanisms used to support business decision-making		D1 Evaluate the benefits and drawbacks of using application software as a mechanism for business processing.
P1 Examine, using examples, the terms 'Business Process' and 'Supporting Processes'.	M1 Differentiate between unstructured and semi-structured data within an organisation.	
LO2 Compare the tools and technologies associated with business intelligence functionality		D2 Compare and contrast a range of information systems and technologies that can be used to support organisations at operational, tactical and strategic levels.
P2 Compare the types of support available for business decision-making at varying levels within an organisation.	M2 Justify, with specific examples, the key features of business intelligence functionality.	

Pass	Merit	Distinction
<p>LO3 Demonstrate the use of business intelligence tools and technologies</p>		<p>D3 Provide a critical review of the design in terms of how it meets a specific user or business requirement and identify what customisation has been integrated into the design.</p>
<p>P3 Determine, with examples, what business intelligence is and the tools and techniques associated with it.</p> <p>P4 Design a business intelligence tool, application or interface that can perform a specific task to support problem-solving or decision-making at an advanced level.</p>	<p>M3 Customise the design to ensure that it is user-friendly and has a functional interface.</p>	
<p>LO4 Discuss the impact of business intelligence tools and technologies for effective decision-making purposes and the legal/regulatory context in which they are used</p>		<p>D4 Evaluate how organisations could use business intelligence to extend their target audience and make them more competitive within the market, taking security legislation into consideration.</p>
<p>P5 Discuss how business intelligence tools can contribute to effective decision-making.</p> <p>P6 Explore the legal issues involved in the secure exploitation of business intelligence tools.</p>	<p>M4 Conduct research to identify specific examples of organisations that have used business intelligence tools to enhance or improve operations.</p>

Transport Network Design

Unit code	T/615/1642
Unit level	5
Credit value	15

Introduction

The exponential growth of the World Wide Web has put unprecedented demands on private and public networking infrastructures. The traffic generated by private and commercial networks has become dominated by Voice-over-IP and video on demand. These developments require existing infrastructures to be adapted and that the design of new networks mitigate best-effort delivery issues, avoid low bandwidths and high latency problems and be based on traffic priority. In order for enterprise networks and internet infrastructures to meet expected demands, their design will have to take into consideration principles such as availability, scalability, resiliency, reliability and quality of service (QoS). As a result, network engineers designing and supporting enterprise or Internet Service Provider networks will need the knowledge and skills to support diverse business needs, such as converged network traffics, centralised control and mission-critical applications.

This unit introduces students to the enterprise network design principles, design models, scalable networks and their effectiveness in supporting business requirements. After evaluating the features of scalable networks, such as availability, reliability and hierarchy, the students are expected to apply network design principles in the design and implementation of redundant networks to provide Layer 2 and Layer 3 redundant solutions. The students are also expected to evaluate Wide Area Network (WAN) technologies and make choices based on specific enterprise requirements, and to implement a range of WAN connections and protocols such as Point-to-Point, Frame Relay and VPN with IPSec using network simulators or network lab equipment. In addition, they will also solve network-related issues using network monitoring and troubleshooting methods and techniques.

Among the topics included in this unit are: network design principles, network design modules, features of enterprise IT networks, such as scalability, reliability, availability and hierarchy, LAN redundancy and related issues, spanning tree protocols, router redundancy protocols, link aggregation, in-band and out-of-band network device management, features and characteristics of WAN networks, WAN technologies and protocols, such as PPP, Frame Relay and VPN with IPSec, network monitoring tools, Network Security, network documentation, network troubleshooting methods and LAN and WAN connectivity issues.

On successful completion of this unit students will be able to evaluate LAN design principles and their application in the network design process, implement a network using LAN design principles based on a predefined set of requirements, produce an appropriate WAN solution to a set of organisational requirements and solve a range of network-related problems using appropriate troubleshooting techniques and methods.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Explore LAN design principles and their application in the network design process.
- LO2 Implement a network using LAN design principles based on a predefined set of requirements.
- LO3 Produce an appropriate WAN solution to a set of organisational requirements.
- LO4 Solve a range of network related problems using appropriate troubleshooting techniques and methods.

Essential Content

LO1 Explore LAN design principles and their application in the network design process

Discuss and evaluate LAN design principles based on business needs:

Analysing diverse business needs: support critical applications, support converged network traffic, centralised administrative control.

Network features: bandwidth, delay, load.

Evaluate LAN design models:

Review of OSI and TCP/IP models, three-layer design model, enterprise architecture design model, features of scalable networks (redundancy, hierarchy, scalability, availability, reliability and small failure domains).

Analyse LAN redundancy:

Issues related to redundancy, spanning tree concepts, Spanning Tree Protocols.

Solving bandwidth and load related issues:

Examine link aggregation concepts and operations, configure link aggregation using EtherChannel technology.

Evaluate the need for redundancy at router level:

Default Gateway related issues, router redundancy protocols.

LO2 Implement a network using LAN design principles based on a predefined set of requirements

Application of LAN design principles in network design and configuration:

Selecting network devices to implement a LAN design: use modularity, stackability, port density, switch forwarding, multi-layer switching and router requirements in the selection process.

Configuring LAN devices:

Compare out-of-band and in-band management, evaluate user interfaces, examine operating system management and licencing issues, basic device configuration.

Implementing Layer 2 LAN redundancy:

Configuration of different Spanning Tree Protocols (STP and Rapid STP).

Implementing Layer 3 LAN redundancy for IPv4:

Configuring First Hop Redundancy Protocols (Hot Standby Routing Protocol, Virtual Router Redundancy Protocol and Gateway Load Balancing Protocol).

Implementing Layer 3 LAN redundancy for IPv6:

Configuring the 'new generation' of redundancy routing protocols e.g. OSPFv3, RIPng (RIP New Generation); stateless address auto-configuration.

LO3 Produce an appropriate WAN solution to a set of organisational requirements

WAN networks and protocols:

Analyse features and requirements of enterprise networks: analyse WAN enterprise architecture, uptime, bandwidth, ISPs, traffic flows, prioritisation, queuing algorithms, latency, QoS models, teleworking.

WAN Technologies:

Examine WAN operations and services, analyse and compare private and public WAN technologies, select the appropriate WAN protocol and service for a specific network requirement.

WAN serial connections:

Configuring Point-to-Point connections using Point-to-Point Protocol (PPP): explain point-to-point serial WAN serial communication, analyse and configure HDLC, analyse and configure PPP.

Configuring Frame Relay:

Analyse and compare Frame Relay and leased lines benefits and drawbacks, explain Frame Relay protocol Permanent Virtual Circuits (PVC), Link Management Interface (LMI) extensions, Data Link Connection Identifier (DLCI) mappings, configure static Frame Relay, implement advanced Frame Relay configurations.

VPN over a public infrastructure connection:

Explaining Virtual Private Network (VPN) features and benefits, compare VPN types, configure site-to-site secure tunnel connections, configure VPN with IP Security (IPSec) and compare IPSec and SSL VPNs (Secure Socket Layer).

LO4 Solve a range of network related problems using appropriate troubleshooting techniques and methods

Network Security considerations:

Network Security issues, their impacts and solutions.

Network monitoring and troubleshooting methods:

Network monitoring tools: analyse, compare and configure Syslog, Network Time Protocol (NTP), NetFlow and Simple Network Management Protocol (SNMP).

Network troubleshooting: establishing network baselines, troubleshooting methods with a systematic approach, gathering information, questioning end users, preparing network documentation, comparing network troubleshooting tools.

Troubleshooting LAN and WAN connectivity issues:

Physical and Data Link layers networking issues and troubleshooting: examine cable faults, device failures, bottlenecks, congestions, attenuation, noise, power issues (redundant power supplies), encapsulation mismatches, STP related issues, etc.

Network layer issues and troubleshooting:

Evaluate divide and conquer method, importance of ipconfig, ping and traceroute commands, subnetting issues, troubleshooting routing protocols, PPP, Frame Relay and VPN configuration issues.

Transport and Application layers networking issues and troubleshooting:

Examine the use of port numbers in Access Control Lists, denying and allowing errors, ACL misconfigurations, NAT, DNS and DHCP related issues.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Explore LAN design principles and their application in the network design process</p>		<p>LO1 & LO2</p> <p>D1 Evaluate different implementations of link aggregation using EtherChannel to solve bandwidth and load issues.</p>
<p>P1 Examine the network design models and features of scalable networks based on a given set of business needs.</p> <p>P2 Discuss LAN redundancy, bandwidth and load related issues and possible solutions with reference to Layer 2 and Layer 3 of the OSI Model.</p>	<p>M1 Analyse the switch and router redundancy protocols and their effectiveness in supporting scalable networks.</p>	
<p>LO2 Implement a network using LAN design principles based on a predefined set of requirements</p>		
<p>P3 Select LAN devices based on features and requirements, and apply basic configuration commands for network connectivity.</p> <p>P4 Implement a LAN design with Layer 2 and Layer 3 redundancy using switch and router redundancy protocols.</p>	<p>M2 Analyse different switch redundancy protocols and their effectiveness in solving redundancy issues.</p> <p>M3 Analyse Layer 3 redundancy implementations for IPv4 and IPv6.</p>	

Pass	Merit	Distinction
<p>LO3 Produce an appropriate WAN solution to a set of organisational requirements</p>		<p>LO3 & 4</p> <p>D2 Evaluate troubleshooting methods and their effectiveness in solving enterprise-wide networking issues.</p>
<p>P5 Examine WAN technologies and select the appropriate one for a set of enterprise requirements.</p> <p>P6 Configure WAN protocols as part of an enterprise network solution.</p>	<p>M4 Analyse the benefits and drawbacks of private and public WAN technologies.</p> <p>M5 Evaluate features and benefits of different VPN types based on organisational needs.</p>	
<p>LO4 Solve a range of network related problems using appropriate troubleshooting techniques and methods</p>		
<p>P7 Deploy network monitoring tools and troubleshooting methods to establish network baselines and produce network documentation.</p> <p>P8 Troubleshoot LAN and WAN connectivity issues at different networking layers.</p>	<p>M6 Develop effective documentation of troubleshooting methods and steps based on a given scenario.</p>

Cloud Computing

Unit code	F/615/1644
Unit level	5
Credit value	15

Introduction

Cloud Computing has revolutionised the way IT services are delivered and has become an important part of the computing sector. Cloud Computing is internet-hosted computing, which means it uses the internet to deliver data and other IT services such as storage, printing, server facilities and so forth. In other words, the end users or organisations no longer need to have their own extensive network environment on the premises, but can get the same services provided virtually over the internet.

The fundamental difference between traditional networking and Cloud Computing is that the technical details of the system are hidden from the end user. That means the networking infrastructure does not have to be on the premises as it would be hosted off-site in the cloud. However, the end user can use the services without the fear of technical difficulties or disasters as it would be managed by the cloud service provider. Cloud Computing is a natural evolution of networking and is adapting the modern network-oriented technologies such as virtualisation, service-oriented architecture, utility computing and ubiquitous computing among others.

This unit is designed to develop an understanding of the fundamental concept of Cloud Computing, cloud segments, and cloud deployment models, the need for Cloud Computing, an appreciation of issues associated with managing cloud service architecture and to develop a critical awareness of Cloud Computing based projects.

Topics included in the unit are the paradigms of networking, fundamentals of Cloud Computing, Cloud Computing architecture, deployment models, service models, security, technological drivers, and cloud service providers.

On successful completion of this unit, students will understand the concept, architecture, and services of Cloud Computing and will gain hands-on experience of configuring a cloud service from major providers such as ECM, Google, Amazon, Microsoft, IBM etc., and implementing a simple cloud platform using open source software with an appropriate networking platform.

As a result students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Demonstrate an understanding of the fundamentals of Cloud Computing and its architectures.
- LO2. Evaluate the deployment models, service models and technological drivers of Cloud Computing and validate their use.
- LO3. Develop Cloud Computing solutions using service provider's frameworks and open source tools.
- LO4. Analyse the technical challenges for cloud applications and assess their risks.

Essential Content

LO1 **Demonstrate an understanding of the fundamentals of Cloud Computing and its architectures**

Networking Paradigm:

Peer-to-peer computing, client-server computing, distributed computing, cluster computing, high-performance computing, parallel computing, grid computing.

Cloud Computing Fundamentals:

Definition of cloud computing, principles of cloud computing, cloud ecosystem, cloud architecture and infrastructure, virtualisation, network connectivity, managing the cloud, application migration to the cloud.

LO2 **Evaluate the deployment models, service models and technological drivers of Cloud Computing and validate their use**

Deployment models:

Private Cloud, Public Cloud, Community Cloud, Hybrid Cloud.

Service models:

IaaS, PaaS, SaaS, AaaS.

Infrastructure as a service (IaaS) is a form of cloud computing that provides virtualized computing resources over the internet. IaaS is one of the three main categories of cloud computing services, alongside software as a service (SaaS) and platform as a service (PaaS)

Software as a service (SaaS) is a cloud computing offering that provides users with access to a vendor's cloud-based software.

Analytics as a service (AaaS) refers to the provision of analytics software and operations through web-delivered technologies.

Technological drivers:

SOA, Virtualisation, Multicore Technology, Memory and Storage Technology, Networking Technology, Web 2.0, & 3.0, Software Process Models for Cloud, Programming Models, Pervasive Computing, Application Environment.

LO3 Develop Cloud Computing solutions using service provider's frameworks and open source tools

Cloud Service Providers:

EMC, Google, Amazon Web Services, Microsoft, IBM, VMware.

Open Source:

Open Source Tools for IaaS, Open Source Tools for PaaS, Open Source Tools for SaaS, Distributed Computing Tools: Cassandra, Hadoop, MongoDB, NGrid, Ganglia.

LO4 Analyse the technical challenges for cloud applications and assess their risks

Security aspects:

Data Security, Virtualisation, Network Security.

Platform related security:

SaaS Security issues, PaaS Security Issues, IaaS Security Issues, Audit and Compliance.

Learning Outcomes and Assessment Criteria

Network Security

Unit code	L/615/1646
Unit level	5
Credit value	15

Introduction

"Who is accessing my network?" A bank was hacked last week? Did you hear about that? Last night I blocked my neighbours from accessing their internet because they did not have a Wireless Equivalent Protection (WEP) or WPA (Wi-Fi Protected Access) key on their wireless."

It is estimated that Network Security (NS) breaches occur every second worldwide from small home networks to massive corporate networks. The cost to businesses is in billions, if not trillions. There are several methods, techniques and procedures that need to be implemented on a network in order for it to be 'secure'. Sometimes basic procedures such as locking your network room, changing your password regularly, as well as putting a password on all your network devices, is all that is needed to achieve some basic network security.

This unit introduces students to the fundamental principles of Network Security practices. As Systems Administration and Management are important tasks in the day-to-day functioning and security of Information Systems, poor or improper practices can lead to loss of data, its integrity, performance reductions, security breaches or total system failure. Special planning and provisions needs to be made for ongoing support of systems and networks, which account for a significant proportion of the IT budget. With the widespread use of computers and the internet for business customers and home consumers, the topic of security continues to be a source for considerable concern.

Among the topics included in this unit are: historical Network Security (NS) principles and associated aspects such as Firewalls, Routers, Switches, MD5, SSL, VPN, AES, SHA-1/2, RSA, DES, 3DES; different types of public and private key cryptography such as Caesar Cipher, IPsec; types of attacks that can be done on a network and methods of preventing such attacks such as Man-In-the-Middle (eavesdropping), Denial of Service (DoS), Distributed Denial of Service (DDoS) (ping); Certificate Authority (CA); 'The Cloud' Security aspects and associated counter-measures such Public Cloud, Private Cloud, Hybrid Cloud, Community Cloud, Platform-as-a-Service (PaaS), Infrastructure-as-a-Service (IaaS), phishing, spoofing, DNS attack, SQL Injection, MAC Address spoofing/control. Firewalls and other Gateways can be used as a tool for Intrusion Detection and Prevention as they can be situated on the perimeter of the Network to provide security.

On successful completion of this unit students will be able to discuss with confidence several types of Network Security measures as well as associated protocols, cryptographic types and configuration settings of Network Security environments. Finally, students will be able to test the security of a given network to identify and fix vulnerabilities.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Examine Network Security principles, protocols and standards.
- LO2. Design a secure network for a corporate environment.
- LO3. Configure Network Security measures for the corporate environment.
- LO4 Undertake the testing of a network using a Test Plan.

Essential Content

LO1 Examine Network Security principles, protocols and standards

The history of Network Security.

Formation and role of CERT, common and advanced cyber security threats and techniques e.g. malware, DoS etc, network vulnerabilities, threat actors, threat actor tools.

Network Security devices:

Security frameworks, Authentication, Authorisation, Accounting (AAA), The historical Network Security (NS) principles and associated aspects such as Firewalls, Routers, Switches.

Network Security protocols:

MD5, SSL, VPN, AES, SHA-1/2, RSA, DES, 3DES, IPSec, DNS, DHCP, HTTP, HTTPS, FTP, FTPs, POP3, SMTP, IMAP.

Network Security cryptographic types:

Different types of public and private key cryptography such as Caesar Cipher, Vigenere, Hash.

LO2 Design a secure network for a corporate environment

Build a network

Planning a network:

Considerations must be thought through on what the network will be used for (purpose) according to the scenario.

Hardware and software considerations:

What hardware and software will be used on the network?

LO3 Configure Network Security measures for the corporate environment

Configure Network Security:

Configure Network Security measures such as Firewalls, Routers, Switches, Gateways, SSL, IPSec, HTTPS, FTPs, passwords and backup devices.

LO4 Undertake the testing of a network using a Test Plan

Testing methods:

Different testing methods should be understood in terms of checks on network connection speed, ethernet cards, testing for network vulnerabilities etc.

Create a Test Plan, test the Network Security and make some recommendations.

Create a Test Plan:

Testing data, expected results, actual results.

Comprehensively Test all devices and the whole environment:

Tests should be carried out on all devices (Firewall, Servers, Domain Controllers, Email Servers, Routers, Switches, gateways, passwords).

Make recommendations:

Make recommendations for improving the Network Security for your environment (scenario).

Learning Outcomes and Assessment Criteria

Pass		Merit	Distinction
LO1 Examine Network Security principles, protocols and standards			LO1 & LO2 D1 Review the importance of network security to an organisation.
P1 Discuss the different types of Network Security devices. P2 Examine Network Security protocols.	M1 Compare and contrast at least two major Network Security protocols.		
LO2 Design a secure network for a corporate environment			
P3 Investigate the purpose and requirements of a secure network according to a given scenario. P4 Determine which network hardware and software to use in this network.	M2 Create a design of a secure network according to a given scenario.		
LO3 Configure Network Security measures for the corporate environment			D2 Review what is meant by Quality of Service (QoS) in relation to Network Security configuration.
P5 Configure Network Security for your network. P6 Discuss different cryptographic types of Network Security.	M3 Provide Network Security configuration scripts/files/screenshots with comments.		
LO4 Undertake the testing of a network using a Test Plan			D3 Critically evaluate the design, planning, configuration and testing of your network.
P7 Create a Test Plan for your network. P8 Comprehensively test your network using the devised Test Plan.	M4 Provide scripts/files/screenshots of the testing of your network. M5 Make some improvement recommendations.

Introduction

Digital computer technologies operate with distinct steps, and data is stored within as separate bits. This method of finite operation is known as 'discrete', and the division of mathematics that describes computer science concepts such as software development, programming languages, and cryptography is known as 'discrete mathematics'. This branch of mathematics is a major part of computer science courses and ultimately aids in the development of logical thinking and reasoning that lies at the core of all digital technology.

This unit introduces students to the discrete mathematical principles and theory that underpin software engineering. Through a series of case studies, scenarios and tasked-based assessments students will explore set theory and functions within a variety of scenarios; perform analysis using graph theory; apply Boolean algebra to applicable scenarios; and finally explore additional concepts within abstract algebra.

Among the topics included in this unit are: set theory and functions, Eulerian and Hamiltonian graphs, binary problems, Boolean equations, Algebraic structures and group theory.

On successful completion of this unit students will be able to gain confidence with the relevant discrete mathematics needed to successfully understand software engineering concepts. As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Examine set theory and functions applicable to software engineering.
- LO2. Analyse mathematical structures of objects using graph theory.
- LO3 Investigate solutions to problem situations using the application of Boolean algebra.
- LO4. Explore applicable concepts within abstract algebra.

Essential Content

LO1 Examine set theory and functions applicable to software engineering

Set theory:

Sets and set operations.

Algebra within set theory.

Set identities and proof of identities.

Bags manipulation functions.

Functions:

Domain, range and mappings.

Inverse relations and the inverse function.

Injective, surjective and transitive functions.

LO2 Analyse mathematical structures of objects using graph theory

Graph theory:

Structure and characterisation of graphs.

Spanning trees and rooted trees.

Eulerian and Hamiltonian graphs.

Vertex and edge colourings of graphs.

Directed graphs:

Directed and directed graphs.

Walks, trails, paths and shortest paths.

LO3 Investigate solutions to problem situations using the application of Boolean algebra

Boolean algebra:

Binary states (e.g. on/off; 1/0; open/closed; high/low).

Identification of binary problems and labelling inputs and outputs.

Produce a truth table corresponding to a problem situation.

Equations:

Express a truth table as a Boolean equation.

Simplify a Boolean equation using algebraic methods.

Represent a Boolean equation using logic gates.

LO4 Explore applicable concepts within abstract algebra

Algebraic structures:

Binary operations and associated properties.

Commutative and associative operations.

Algebraic structures and substructures.

Groups:

Introduction to groups, semigroups and monoids.

Families of groups and group codes.

Substructures and morphisms.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Examine set theory and functions applicable to software engineering		D1 Formulate corresponding proof principles to prove properties about defined sets.
P1 Perform algebraic set operations in a formulated mathematical problem. P2 Determine the cardinality of a given bag (multiset).	M1 Determine the inverse of a function using appropriate mathematical techniques.	
LO2 Analyse mathematical structures of objects using graph theory		D2 Construct a proof of the Five Colour Theorem.
P3 Model contextualised problems using trees, both quantitatively and qualitatively. P4 Use Dijkstra's algorithm to find a shortest path spanning tree in a graph.	M2 Assess whether an Eulerian and Hamiltonian circuit exists in an undirected graph.	

Pass	Merit	Distinction
<p>L03 Investigate solutions to problem situations using the application of Boolean algebra</p>		<p>D3 Design a complex system using logic gates.</p>
<p>P5 Diagram a binary problem in the application of Boolean Algebra.</p> <p>P6 Produce a truth table and its corresponding Boolean equation from an applicable scenario.</p>	<p>M3 Simplify a Boolean equation using algebraic methods.</p>	
<p>L04 Explore applicable concepts within abstract algebra</p>		<p>D4 Explore with the aide of a prepared presentation the application of group theory relevant to your course of study.</p>
<p>P7 Describe the distinguishing characteristics of different binary operations that are performed on the same set.</p> <p>P8 Determine the order of a group and the order of a subgroup in given examples.</p>	<p>M4 Validate whether a given set with a binary operation is indeed a group.</p>

Introduction

The knowledge to implement algorithms and data structures that solve real problems, and knowing the purpose, complexity and use of algorithms is part of an essential toolkit for software engineers. An algorithm is a sequence of instructions used to manipulate data held in a structured form and together constitute design patterns for solving a diverse range of computer problems, including network analysis, cryptography, data compression and process control.

This unit introduces students to data structures and how they are used in algorithms, enabling them to design and implement data structures. The unit introduces the specification of abstract data types and explores their use in concrete data structures. Based on this knowledge, students should be able to develop solutions by specifying, designing and implementing data structures and algorithms in a variety of programming paradigms for an identified need.

Among the topics included in this unit are abstract data types specification, formal data notations, data encapsulation, complex data structures, programming language implementations using handles, pointers, classes and methods, algorithm types, data structure libraries, algorithm complexity, asymptotic testing and benchmarking.

On completion of this unit the student should be able to identify program data requirements, specify abstract data types using a formal notation, translate into concrete data structures and be able to develop, using a programming paradigm, different sorting, searching and navigational algorithms that implement complex data structures and evaluate their effectiveness.

As a result of studying this unit students will develop skills such as communication literacy, critical thinking, analysis, synthesis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of the unit students will be able to:

- LO1. Examine abstract data types, concrete data structures and algorithms.
- LO2. Specify abstract data types and algorithms in a formal notation.
- LO3. Implement complex data structures and algorithms.
- LO4. Assess the effectiveness of data structures and algorithms.

Essential Content

LO1 Examine abstract data types, concrete data structures and algorithms

Abstract Data Types (ADTs):

Specification of ADTs with formal notation.

Data structures:

Array; set; stack; queue; list; tree; types e.g. active, passive, recursive.

Algorithm types:

Recursive, backtracking, dynamic, divide & conquer, branch & bound, greedy, randomised, brute force.

Algorithms:

Sort; insertion, quick, merge, heap, bucket, selection; search linear, binary, binary search tree, recursive e.g. binary tree traversals; find path; travelling salesman.

LO2 Specify abstract data types and algorithms in a formal notation

Design specification:

Specify ADTs using formal notation e.g. ASN.1; use non-executable program specification language e.g. SDL, VDM; issues e.g. complexity in software development; design patterns, parallelism; interfaces; encapsulation, information hiding, efficiency.

Creation:

Pre-conditions, post-conditions, error-conditions.

LO3 Implement complex data structures and algorithms

Implementation:

Data structures; multidimensional arrays, linked lists, stacks, queues, trees, hash table, heap, graph Algorithms; sorting, searching, tree traversal, list traversal, hash functions, string manipulation, scheduling and recursive algorithms; using handle, pointer, class, methods; using an executable programming language.

LO4 **Assess the effectiveness of data structures and algorithms**

Use of data structure libraries (DSL):

Limitations of DSL; manual selection of data structures; theoretical analysis; asymptotic analysis; size of N, Big O notation.

Algorithm effectiveness:

Run time benchmark, compiler/interpreter dependencies, resource usage, degree of parallelism, time, space, power performance, efficiency of garbage collection.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Examine abstract data types, concrete data structures and algorithms</p>		<p>D1 Analyse the operation, using illustrations, of two network shortest path algorithms, providing an example of each.</p>
<p>P1 Create a design specification for data structures explaining the valid operations that can be carried out on the structures.</p> <p>P2 Determine the operations of a memory stack and how it is used to implement function calls in a computer.</p>	<p>M1 Illustrate, with an example, a concrete data structure for a First In First out (FIFO) queue.</p> <p>M2 Compare the performance of two sorting algorithms.</p>	
<p>LO2 Specify abstract data types and algorithms in a formal notation</p>		<p>D2 Discuss the view that imperative ADTs are a basis for object orientation and, with justification, state whether you agree.</p>
<p>P3 Using an imperative definition, specify the abstract data type for a software stack.</p>	<p>M3 Examine the advantages of encapsulation and information hiding when using an ADT.</p>	

Pass	Merit	Distinction
<p>L03 Implement complex data structures and algorithms</p>		<p>D3 Critically evaluate the complexity of an implemented ADT/algorithm.</p>
<p>P4 Implement a complex ADT and algorithm in an executable programming language to solve a well-defined problem.</p> <p>P5 Implement error handling and report test results.</p>	<p>M4 Demonstrate how the implementation of an ADT/algorithm solves a well-defined problem.</p>	
<p>L04 Assess the effectiveness of data structures and algorithms</p>		<p>D4 Evaluate three benefits of using implementation independent data structures.</p>
<p>P6 Discuss how asymptotic analysis can be used to assess the effectiveness of an algorithm.</p> <p>P7 Determine two ways in which the efficiency of an algorithm can be measured, illustrating your answer with an example.</p>	<p>M5 Interpret what a trade-off is when specifying an ADT using an example to support your answer.</p>

Advanced Programming

Unit code	Y/615/1651
Unit level	5
Credit value	15

Introduction

Features of programming languages that are considered advanced are used to develop software that is efficient; it can affect the performance of an application as well as the readability and extensibility of the code, improving productivity and therefore reducing cost. Many commercial applications available today, whether for productivity or entertainment, will have used one or more design pattern in their development. A design pattern is a description of how to solve a problem that can be used in many different situations and can help deepen the understanding of object-orientated programming and help improve software design and reusability.

The aim of this unit is to familiarise students with these features and their best practices to ensure that their code is in line with industry standards.

Among the topics included in this unit are: object-orientated programming; polymorphism, encapsulation, class aggregation/association, constructors/destructors, inheritance, abstract classes, interfaces, containers, generics, introduction to design patterns and Unified Modelling Language (UML).

On successful completion of this unit students will be able to write code in an object-orientated fashion using design patterns where necessary and be able to model their code structure in UML class diagrams. As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Examine the key components related to the object-orientated programming paradigm, analysing design pattern types.
- LO2. Design a series of UML class diagrams.
- LO3. Implement code applying design patterns.
- LO4. Investigate scenarios with respect to design patterns.

Essential Content

LO1 **Examine the key components related to the object-orientated programming paradigm, analysing design pattern types**

Outline the object-orientated paradigm characteristics:

Encapsulation, polymorphism, constructors/destructors, sub objects, abstract/concrete, interface, method redefinition, generics/templates, containers.

Object-orientated class relationships:

Generalisation/inheritance, realisation, dependency, aggregation, composition.

Design patterns:

Creational, structural and behavioural.

LO2 **Design a series of UML class diagrams**

UML class design:

Analyse a code scenario and utilise a suitable UML tool to develop class diagrams.

LO3 **Implement code applying design patterns**

Implementation:

Using an appropriate language & IDE to develop code that implements design patterns and utilises techniques to produce secure code.

LO4 **Investigate scenarios with respect to design patterns**

Review the usage of design patterns:

Relating design patterns to a range of given scenarios

Learning Outcomes and Assessment Criteria

Pass		Merit	Distinction
L01 Examine the key components related to the object-orientated programming paradigm, analysing design pattern types			D1 Analyse the relationship between the object-orientated paradigm and design patterns.
P1 Examine the characteristics of the object-orientated paradigm as well as the various class relationships.	M1 Determine a design pattern from each of the creational, structural and behavioural pattern types.		
L02 Design a series of UML class diagrams			D2 Analyse how class diagrams can be derived from a given code scenario using a UML tool.
P2 Design and build class diagrams using a UML tool.	M2 Define class diagrams for specific design patterns using a UML tool.		
L03 Implement code applying design patterns			D3 Evaluate the use of design patterns for the given purpose specified in M3.
P3 Build an application derived from UML class diagrams.	M3 Develop code that implements a design pattern for a given purpose.		
L04 Investigate scenarios with respect to design patterns			D4 Critically evaluate a range of design patterns against the range of given scenarios with justification of your choices.
P4 Discuss a range of design patterns with relevant examples of creational, structural and behavioural pattern types.	M4 Reconcile the most appropriate design pattern from a range with a series of given scenarios.

Unit 41: Analytic Architecture Design

Unit 21: Data Mining

Unit code	H/615/1653
Unit level	5
Credit value	15

Introduction

Data mining is the process of discovering new knowledge in the forms of patterns and relationships in large data sets. It helps find knowledge from a data set that was previously impossible to obtain with traditional methods. Modern data mining is well equipped to discover useful knowledge or patterns from unstructured data such as web traffic, emails and social media content. Data mining uses a range of machine learning algorithms and modern statistical techniques to discover knowledge from data sets.

This unit will introduce the theoretical foundation of data mining and a range of data mining processes and techniques. The unit will also provide hands-on experience in developing data mining applications using an appropriate programming language or data mining tool.

Topics included in this unit are: data mining terminologies, scope of data mining such as classification, regression and clustering methods and techniques, associate pattern mining, mining time series data, and mining text data.

On successful completion of this unit, students will appreciate the theoretical and technical concepts of data mining and its techniques and processes, gain hands-on experience in implementing data mining techniques using a programming language such as Python, R, or a tool such as Weka, KNIME, Excel etc.

As a result students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

It is assumed that students will have some knowledge of data analytics and machine learning, or will have completed Unit 12: Data Analytics and Unit 26: Machine Learning.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Discuss the historical and theoretical foundation of data mining, its scope, techniques, and processes.
- LO2. Investigate a range of data mining techniques to discover patterns and relationships in large data sets.
- LO3. Illustrate how a data mining algorithm performs text mining to identify relationships within text.
- LO4. Evaluate a range of graph data mining techniques that recognise patterns and relationships in graph-based technologies.

Essential Content

LO1 **Discuss the historical and theoretical foundation of data mining, its scope, techniques, and processes**

Data mining terminologies.

Historical background of data mining:

Traditional approach, modern approach.

Theoretical background of data mining.

Ethics of data mining:

Fundamentals of data mining, the major building blocks of data mining.

LO2 **Investigate a range of data mining techniques to discover patterns and relationships in large data sets**

Scope of data mining:

Classification, regression and clustering.

Data mining algorithms:

Classification algorithms, regression algorithms and clustering algorithms.

LO3 **Illustrate how a data mining algorithm performs text mining to identify relationships within text**

Introduction to text mining.

A brief overview to natural language processing.

Document preparation and similarities.

Clustering methods.

Topic Modelling.

Presentation methods of text (final outcome of the mining): charts, graphs, word cloud and so forth.

LO4 Evaluate a range of graph data mining techniques that recognise patterns and relationships in graph-based technologies

Unstructured data and graph-based technologies.

Networks and network analysis.

Graph algorithms: graph pattern mining, graph classification, graph clustering, and so forth.

Content mining, structure mining and usage mining.

Graph data mining tools.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction

Unit 26: Machine Learning

Unit 22:

Applied Analytical Models

Unit code	K/615/1654
Unit level	5
Credit value	15

Introduction

Applied analytical modelling has become prevalent in many industries and has developed in the mathematical techniques used and the diversity of modelling tools and techniques. Applied analytical modelling is carried out by a data scientist utilising modelling data, model building and model reporting skills. The aim of this unit is to provide students with knowledge and analytical modelling skills using computers to discover and interpret meaningful patterns in data by creating computer models.

This unit introduces students to applied analytical models used in business to discover, interpret and communicate meaningful patterns of data held in silos or data warehouses, and to derive knowledge to gain competitive advantage. Organisations may apply analytical methods and models to predict/prescribe business outcomes and improve performance in diverse areas such as stock control, financial risk and fraud analysis. Analytical models use mathematical algorithms and require extensive computation to process large amounts of data.

Among the topics included in this unit are: data preparation, fundamentals of applied analytical models and development of predictive or prescriptive models using a suitable algorithm, operating on a large data set.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Examine applied analytical modelling methods.
- LO2. Prepare a large data set for use in an applied analytical model.
- LO3. Demonstrate the use of an analytical model with a large data set.
- LO4. Investigate improvements to an applied analytical model.

Essential Content

LO1 Examine applied analytical modelling methods

Decision/descriptive analytics.

Prescriptive analytics:

Confirmatory data analysis (CDA).

Predictive analytics:

Forecasting or classification algorithms, machine learning, scoring, correlation, causation, regression analysis.

Algorithms:

Filtering, sorting clustering; Data visualisation.

Business Domains:

Behavioural analytics; cohort analytics; collections analytics; cyber analytics; enterprise optimisation; financial analytics; fraud analytics; marketing analytics; pricing analytics; retail analytics; risk analytics; supply chain analytics; talent analytics; telecoms analytic; transportation analytics.

LO2 Prepare a large data set for use in an applied analytical model

Identify and evaluate applied analytical model data requirements:

Data requirements; data collection, data processing; semi-structured/unstructured metadata processing, cleaning; aggregation; exploratory data analysis (EDA); data product; data visualisation; information displays; dashboards.

LO3 Demonstrate the use of an analytical model with a large data set

Define analytic model requirements:

Data set selection; carry out cleaning, aggregation and EDA; identification of algorithm, selection and configuration of data mining software; model implementation; communication of results; data visualisation; graphical reports/dashboards.

LO4 Investigate improvements to an applied analytical model

Data quality; data assumptions; sampling; segmentation; uplift data modelling; algorithm selection; pattern and relationship discovery; qualitative/quantitative use; validating results; output communication methods; tailoring data visualisation.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Examine applied analytical modelling methods		
<p>P1 Discuss the prescriptive and predictive analytical models, using examples.</p> <p>P2 Illustrate three analytical methods, describing how they function.</p>	<p>M1 Compare prescriptive and predictive analytical models, stating their advantages and disadvantages.</p>	
LO2 Prepare a large data set for use in an applied analytical model		
<p>P3 Describe the process of analytical model data preparation, describing data cleaning, discretisation, aggregation and data reduction stages.</p> <p>P4 Suggest two methods to visualise the output from an applied analytical model, using illustrations to describe your answer.</p>	<p>M2 Analyse three potential issues in preparation of data for use in an applied analytical model.</p>	

Pass	Merit	Distinction
<p>LO3 Demonstrate the use of an analytical model with a large data set</p>		<p>D3 Review the results of the investigation, assessing the quality of the obtained knowledge.</p>
<p>P5 Select a suitable algorithm to analyse a large data set to meet a business need.</p> <p>P6 Use an appropriate analytical modelling tool to carry out an investigation (e.g. R, RapidMiner, Hadoop).</p>	<p>M3 Propose how the data set will be prepared for the analytical model used in the investigation.</p>	
<p>LO4 Investigate improvements to an applied analytical model</p>		<p>D4 Present the results of your investigation promoting the benefits of using applied analytical models in a business.</p>
<p>P7 Investigate improvements to an applied analytical model.</p>	<p>M4 Propose three improvements to the approach used in the investigation.</p> <p>M5 Discuss two ways to increase the performance and limits of the analytical model used in the investigation.</p>

Cryptography

Unit code	T/615/1656
Unit level	5
Credit value	15

Introduction

Although confidentiality in the communication between two parties is very often linked with electronic data transfer, methods for ensuring confidentiality have been used for centuries. That is how cryptography started as a methodology, practice and discipline, ensuring confidential communication in the presence of third parties called 'adversaries'. However, encrypting the message for confidentiality purposes is only one aspect of cryptography. It also provides means of ensuring that the parties involved in communication are 'who they say they are'. Cryptography underpins many aspects of security, and is a crucial component in protecting the confidentiality and integrity of information. It is now a prevalent part of our day-to-day lives despite many people being unaware of its usage or importance. Almost every interaction we make with an electronic device will involve cryptography in some form. Cryptography is an indispensable tool for protecting information in computer systems.

This unit introduces students to the theoretical principles of cryptography and looks at some practical applications, many of which we use on a daily basis. Students are expected to investigate the inner workings of cryptographic systems and how to correctly use them in real-world applications. Students are expected to explore the mathematical algorithms in relation to cryptography and their applications. Students are also expected to analyse the symmetric and asymmetric encryption methods and ciphers, public key cryptography and the security issues related to their implementation. In addition, students are expected to investigate advanced encryption protocols and their applications.

Among the topics included in this unit are: the mathematical algorithms used in cryptography, the mechanisms by which symmetric and asymmetric cryptography work, 3DES and AES block ciphers, the operations of public key cryptography, Public Key Infrastructure (PKI), primality testing and factoring, discreet logarithms, El Gamal encryption, security issues with cryptography, common attacks on cryptographic schemes, and some practical applications of cryptography.

On successful completion of this unit students will be able to examine the symmetric encryption algorithms and ciphers, assess public key encryption protocols and signatures and their uses in the message and key exchanges, analyse the security issues related to symmetric and asymmetric encryption methods and evaluate advanced encryption protocols and their applications in secure message exchanges.

As a result they will develop skills such as critical thinking, analysis, and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Examine the symmetric encryption algorithms and ciphers.
- LO2. Assess public key encryption protocols and signatures and their uses in the message and key exchanges.
- LO3. Analyse the security issues related to symmetric and asymmetric encryption methods.
- LO4 Evaluate advanced encryption protocols and their applications in secure message exchanges.

Essential Content

LO1 Examine the symmetric encryption algorithms and ciphers

Exploring mathematical algorithms:

Examining modular arithmetic, groups, finite fields and probability; random number generation, exploring elliptic curves and projective coordinates.

Examining symmetric encryption and ciphers:

Exploring historical ciphers, Cezar cipher, Enigma machine and information theoretic security (probability and ciphers, entropy and spurious keys); explaining one time pad.

Investigating stream ciphers, the historical Lorenz cipher, modern stream ciphers (linear feedback shift registers and their combinations, RC4).

Examining block ciphers, Feistel cipher and Data Encryption Standard (DES), operation of 3DES, Rijndael cipher and its mode of operation, explaining Advanced Encryption System (AES).

Analysing symmetric key distributions, hash functions and message authentication codes – key management, secret key distribution, designing hash functions, investigating message authentication codes.

LO2 Assess public key encryption protocols and signatures and their uses in the message and key exchanges

Analysing public key cryptography:

Examining public key encryption algorithms, one-way functions, Rivest Shamir Adleman (RSA) algorithm; explaining El Gamal encryption.

Explaining primality testing and factoring and discrete logarithms, prime numbers, factoring algorithms, modern factoring methods; examining Pohlig-Hellman logarithm, logarithmic methods for finite fields, methods for elliptic curves.

Examining key exchange and signature schemes, Diffie-Hellman key exchange, explore digital signatures, using hash functions in signature schemes, digital signature algorithm (DSA), and authenticated key agreement.

Analysing implementation issues and, exponentiation in RSA and DSA, finite field arithmetic.

Obtaining authentic public keys, confidentiality and integrity, digital certificates and Public Key Infrastructure (PKI), analysing examples of PKI.

LO3 **Analyse the security issues related to symmetric and asymmetric encryption methods**

Analysing attacks on public key schemes:

Exploring most common attacks on public key encryption schemes, Wiener's attack on RSA, Lattice-based attacks on RSA, partial key exposure attacks, Meet-in-the-Middle attack, brute force attack and fault analysis.

Analysing different definitions of security:

Examining security of encryption, security of actual encryption algorithms, semantically secure systems, security of signatures.

Analysing provable security, explaining random oracles, security of encryption algorithms and encryption algorithms with random oracles.

Explaining provable security without random oracles, using examples such as strong RSA assumption, signature schemes and encryption schemes.

Analysing hybrid encryption, security of symmetric ciphers, security of hybrid ciphers, explaining the construction of Key Encapsulation Mechanisms (KEMs)

LO4 **Evaluate advanced encryption protocols and their applications in secure message exchanges**

Assessing advanced encryption protocols and their applications:

Evaluating access structures for secret sharing schemes, general secret sharing, Reed-Solomon codes, Shamir sharing scheme.

Applying shared RSA signature generation; explaining commitment schemes and oblivious transfers.

Analysing Zero-Knowledge proofs, demonstrating a Graph Isomorphism in Zero-Knowledge, Sigma protocols, electronic voting systems.

Examining secure multi-party computation, the two-party case, multi-party cases: honest-but-curious adversaries, malicious adversaries.

Evaluating different applications of cryptography, quantum cryptography, digital cash, Bitcoin, Transport Layer Security and IPSec.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Examine the symmetric encryption algorithms and ciphers</p>		<p>LO1 & LO2</p> <p>D1 Evaluate the improvement introduced by AES compared to DES and 3DES encryption standards and public key and private key encryption.</p>
<p>P1 Examine mathematic algorithms and their use in cryptography.</p> <p>P2 Explain, with the use of examples, the operation of stream cipher and block cipher.</p>	<p>M1 Compare the operational differences between stream cipher and block cipher.</p> <p>M2 Analyse issues with symmetric key distribution and how they are solved by hash functions and message authentication codes.</p>	
<p>LO2 Assess public key encryption protocols and signatures and their uses in the message and key exchanges</p>		
<p>P3 Discuss common public key cryptographic methods and their uses.</p> <p>P4 Explain by the use of examples public key exchange and digital signatures, and their implementation issues.</p>	<p>M3 Analyse, with examples, the Public Key Infrastructure (PKI).</p>	

Pass	Merit	Distinction
LO3 Analyse the security issues related to symmetric and asymmetric encryption methods	M4 Critically analyse the security of hybrid ciphers and the construction of Key Encapsulation Mechanisms (KEMs).	D2 Evaluate different definitions of provable security.
P5 Discuss the common attacks on public key encryption schemes. P6 Explain, with examples, provable security in signature schemes and encryption schemes.		
LO4 Evaluate advanced encryption protocols and their applications in secure message exchanges	M5 Analyse the implementation of public key cryptography in electronic voting systems.	D3 Critically evaluate the access structures for secret sharing schemes.
P7 Examine, by the use of examples, secret sharing schemes. P8 Evaluate secure multi-party computation using the two-party and multi-party cases.

Unit 24: Forensics

Unit 25: Information Security Management

Unit 24:

Forensics

Unit code	F/615/1658
Unit level	5
Credit value	15

Introduction

This unit introduces students to digital forensics involving the use of specialised techniques to investigate the recovery, authentication and analysis of data on electronic data storage devices as well as Network Security breaches and cyberattacks using different tools and techniques.

With the current widespread use of digital devices, digital forensics has become an important part of the detection of crime by being able to identify details of what has been stored on a digital device(s) in the past. Students will have the opportunity to learn about some of the lower level structures of data storage devices, and techniques used to investigate them.

Among the topics included in this unit are: describing the process of carrying out digital forensics; Forensic Investigation legal guidelines and procedures; understanding low level file structures of several Operating Systems (OS); creating a boot disk to enable forensic examination of devices; and undertaking a forensic examination of a device(s) and/or Network Security breaches and cyberattacks.

On successful completion of this unit students will be able to carry out digital forensics in accordance with industry and legal guidelines and procedures using different tools as well as understand low-level file structures of several Operating Systems and undertake digital Forensic Investigation of devices.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Examine the processes and procedures for carrying out digital Forensic Investigation.
- LO2. Discuss the legal and professional guidelines and procedures for carrying out digital Forensic Investigation.
- LO3. Use a tool or tools to conduct digital Forensic Investigation on devices or networks or cyberattacks.
- LO4. Develop a Test Plan and make some recommendations for use in digital Forensic Investigation.

Essential Content

LO1 **Examine the processes and procedures for carrying out digital Forensic Investigation**

The process of carrying out digital Forensic Investigation:

Discuss what is meant by Digital Forensics.

Identify the processes and procedures for carrying out digital Forensic Investigation.

LO2 **Discuss the legal and professional guidelines and procedures for carrying out digital Forensic Investigation**

Processes and procedures for carrying out digital Forensic Investigation:

Law enforcement:

Give a summary of the APCO guidelines in relation to evidence collection, evidence preservation in a Forensic Investigation case. Discuss the activities of authorities (e.g. MI5/MI6, GCHQ and NSA) in relation to Forensic Investigations.

Legal and ethical considerations:

Discuss the following legal and ethical considerations when conducting a Forensic Investigation; Data Protection Act; Computer Misuse Act and the Freedom of Information Act.

Other stakeholders:

Forensic Science's Society guidelines

British Computer Society

LO3 **Use a tool or tools to conduct digital Forensic Investigation on devices or networks or cyberattacks**

Tools required to conduct digital Forensic Investigation:

Hardware and software tools.

Conduct digital Forensic Investigation:

Conduct digital Forensic Investigation of devices, networks or cyberattacks.

LO4 Develop a Test Plan and make some recommendations for use in digital Forensic Investigation

Develop a Test Plan for digital devices or networks or cyberattacks:

Digital Forensics Test Plan

Recommendations for improving digital Forensic Investigations.

Learning Outcomes and Assessment Criteria

Unit 25: Information Security Management

Unit code	F/615/1661
Unit level	5
Credit value	15

Introduction

Organisations of all sizes need to protect their sensitive information from potential attackers, and simply having up-to-date firewalls, anti-virus, and other infrastructure components is not enough to prevent breaches. All physical security devices, the teams who manage them, and the processes surrounding their management need to be constantly monitored and evaluated to ensure the organisation as a whole is protected. This is the concept behind an Information Security Management System (ISMS). An ongoing process to continually assess what the organisation deems its biggest threats, and what its most important assets are.

This unit introduces students to the basic principles of an ISMS and how businesses use them to effectively manage the ongoing protection of sensitive information they hold. There are many reasons for establishing an ISMS for an organisation, but one of the main goals is to enable the organisation to manage information security as a single entity which can be monitored and continually improved upon.

This unit considers information security management in a business context and will allow students to understand how modern organisations manage the ongoing threats to their sensitive assets.

On successful completion of this unit students will be able to describe what an ISMS is, how one is established, maintained and improved, and describe the role international standards play in developing an ISMS. As a result students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Explore the basic principles of information security management.
- LO2. Critically assess how an organisation can implement and maintain an Information Security Management System (ISMS).
- LO3. Appraise an ISMS and describe any weaknesses it may contain.
- LO4. Examine the strengths and weaknesses of implementing ISMS standards.

Essential Content

LO1 Explore the basic principles of information security management

What is an ISMS? Why is an ISMS important? Policies (privacy, acceptable use, information security, separation of duties, least privilege); risk (impact, likelihood, quantitative, qualitative, vulnerabilities, threats); risk treatment (avoid, transfer, accept, mitigate); compliance; stakeholders.

LO2 Critically assess how an organisation can implement and maintain an Information Security Management System (ISMS)

Asset identification; stakeholder requirements; risk assessment; risk treatment planning; policy development; procedure development; senior management buy-in; audit (internal, external); performance monitoring; continual improvement.

LO3 Appraise an ISMS and describe any weaknesses it may contain

Review ISMS documentation for potential weaknesses; examine audit and performance monitoring output; suggest improvements to an ISMS.

LO4 Examine the strengths and weaknesses of implementing ISMS standards

ISO 27001:2013; the organisation and its context; expectations of interested parties; determining ISMS scope; leadership commitment; policy; organisational roles and responsibilities; actions to address risks; information security objectives; resources; competence; awareness; communications; documented information; operational planning; risk assessment; risk treatment; monitoring, measuring, analysis and evaluation; management review; nonconformity and corrective action; continual improvement; external ISMS audit; advantages and disadvantages of ISO 27001:2013 certification; annex A (ISO 27002:2013) controls.

Learning Outcomes and Assessment Criteria

Pass		Merit	Distinction
LO1 Explore the basic principles of information security management			LO1 & LO2 D1 Demonstrate through critical analysis the steps required to establish and maintain an ISMS in the context of an example organisation, making reference to the requirements of the ISO 27001:2013 standard.
P1 Examine the key principles of an ISMS and its relevance to the successful operation of an organisation.	M1 Evaluate the benefits an effective ISMS can have on an organisation.		
LO2 Critically assess how an organisation can implement and maintain an Information Security Management System (ISMS)			
P2 Explore the elements of, and processes behind, establishing and maintaining an ISMS.	M2 Examine the process of implementing an ISMS in a real-world scenario.		

Pass	Merit	Distinction
LO3 Appraise an ISMS and describe any weaknesses it may contain		LO3 & LO4 D2 Critically examine the strengths and weaknesses in the context of an example ISMS and provide potential remedial actions to improve its effectiveness.
P3 Recognise strengths and weaknesses in a given ISMS, based on documentation review and audit output.	M3 Examine the strengths and weaknesses of an ISMS in the context of an organisation, prioritising issues.	
LO4 Examine the strengths and weaknesses of implementing ISMS standards		
P4 Recognise the purpose of the ISO 27000 series and the key clauses of ISO 27001:2013.	M4 Evaluate the relationship between ISO 27001:2013 and establishing an effective ISMS within an organisation. M5 Critically assess the advantages and disadvantages of certification against the standard.

Machine Learning

Unit code	J/615/1662
Unit level	5
Credit value	15

Introduction

Machine learning is the science of getting computers with the ability to learn from data or experience to solve a given problem without being explicitly programmed. It has been around for many years, however it has become one of the hottest fields of study in the computing sector. Machine learning is in use in several areas such as predictive modelling, speech recognition, object recognition, computer vision, anomaly detection, medical diagnosis and prognosis, robot control, time series forecasting and much more.

This unit will introduce the basic theory of machine learning, the most efficient machine learning algorithms and practical implementation of these algorithms. Students will gain hands-on experience in getting these algorithms to solve real-world problems.

Topics included in this unit are: the foundations of machine learning, types of learning problems (classification, regression, clustering etc.), taxonomy of machine learning algorithms (supervised learning, unsupervised learning, reinforcement learning), machine learning algorithms (Decision Tree, Naïve Bayes, k-Nearest Neighbour, Support Vector Machine etc.).

On successful completion of this unit students will be able to understand the concept of machine learning, machine learning algorithms, gain hands-on experience in implementing algorithms using a programming language such as C/C++, C#, Java, Python, R, or a machine learning tool such as Weka, KNIME, MS AzureML etc.

As a result students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Analyse the theoretical foundation of machine learning to determine how an intelligent machine works.
- LO2. Investigate the most popular and efficient machine learning algorithms used in industry.
- LO3. Develop a machine learning application using an appropriate programming language or machine learning tool for solving a real-world problem.
- LO4. Evaluate the outcome or the result of the application to determine the effectiveness of the learning algorithm used in the application.

Essential Content

LO1 **Analyse the theoretical foundation of machine learning to determine how an intelligent machine works**

Consideration of what learning is.

Definitions of machine learning.

Core terminologies of machine learning.

Types of learning problems: classification, regression, optimisation, clustering.

How does machine learning work? Supervised learning, unsupervised learning, reinforcement learning, semi-supervised learning, deep learning.

LO2 **Investigate the most popular and efficient machine learning algorithms used in industry**

Machine learning algorithms and appropriate programming languages or tools:

Introduction to programming languages or tools.

Introduction to the language or tool.

A quick tour of the language or tool.

Investigating the mathematical background of machine learning with the programming language or tool:

Formulas, functions, descriptive statistics and graphs, probability.

Investigate the machine learning algorithm and demonstrate using the programming language or a tool:

K-Nearest Neighbour, Support Vector Machine, Linear Regression, Decision Tree, Naïve Bayes, K-Means Clustering.

LO3 Develop a machine learning application using an appropriate programming language or machine learning tool for solving a real-world problem

Problem definition:

Investigate and characterise the problem in order to better understand the goals of the project.

Data analysis:

Understand the available data (rows, columns, classes data range and so forth).

Data preparation:

Separate the data as training sets and testing set in order to expose better the structure of the prediction to modelling algorithms.

Implement the algorithm:

Implement the algorithm with an appropriate programming language or tool, train the model using training data set, present results.

LO4 Evaluate the outcome or the result of the application to determine the effectiveness of the learning algorithm used in the application

Improving models' accuracy.

The cause of poor performance in machine learning is either overfitting or underfitting the data.

Under-fitting situations: The cause of poor performance in machine learning is either overfitting or underfitting the data.

Over-fitting situations: Overfitting happens when a model learns the detail and noise in the training data to the extent that it negatively impacts the performance of the model on new data.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Analyse the theoretical foundation of machine learning to determine how an intelligent machine works		LO1 & LO2 D1 Critically evaluate why machine learning is essential to the design of intelligent machines.
P1 Analyse the types of learning problems. P2 Demonstrate the taxonomy of machine learning algorithms.	M1 Evaluate the category of machine learning algorithms with appropriate examples.	
LO2 Investigate the most popular and efficient machine learning algorithms used in industry		
P3 Investigate a range of machine learning algorithms and how these algorithms solve the learning problems. P4 Demonstrate the efficiency of these algorithms by implementing them using an appropriate programming language or machine learning tool.	M2 Analyse these algorithms using an appropriate example to determine their power.	

Pass	Merit	Distinction
<p>LO3 Develop a machine learning application using an appropriate programming language or machine learning tool for solving a real-world problem</p>		
<p>P5 Chose an appropriate learning problem and prepare the training and test data sets in order to implement a machine learning solution.</p> <p>P6 Implement a machine learning solution with a suitable machine learning algorithm and demonstrate the outcome.</p>	<p>M3 Test the machine learning application using a range of test data and explain each stages of this activity.</p>	<p>LO3 & LO4</p> <p>D2 Critically evaluate the implemented learning solution and it's effectiveness in meeting end user requirements.</p>
<p>LO4 Evaluate the outcome or the result of the application to determine the effectiveness of the learning algorithm used in the application</p>		
<p>P7 Discuss whether the result is balanced, under-fitting or over-fitting.</p> <p>P8 Analyse the result of the application to determine the effectiveness of the algorithm</p>	<p>M4 Evaluate the effectiveness of the learning algorithm used in the application.</p>

Artificial Intelligence

Unit code L/615/1663

Unit level 5

Credit value 15

Introduction

One of the dreams of the computing sector is to build an intelligent digital assistant that could serve people according to peoples' nature. Building this type of intelligent machine is a big challenge to computer scientists. An intelligent machine must have at least the following behaviours – vision, speech and voice recognition, smelling sense, learning from experience to solve new problems and coping with the unknown. The science of artificial intelligence (AI) is trying to overcome these challenges by combining the study of nature, understanding from humans' intelligent behaviour and brain function, other animal's acute senses, with mathematics, statistics, logic and traditional computer science. Some of AI's achievements include the NASA's Mars Rover, Google's Self-Driving Cars, IBM's Watson, Microsoft's Xbox 360 (the first gaming device to track human body movement) and much more.

This unit is designed to introduce the philosophy behind artificial intelligence, the most efficient techniques of AI and various intelligent systems that help us to overcome various challenges. This unit guides the student to investigate the emerging AI technologies which could solve various real-world challenges and problems.

Topics included in this unit are the philosophical background to AI, current trends and the future of AI, ethics and issues in AI, a range of AI applications (computer vision, speech processing and so forth), top-down approach of AI techniques, fuzzy logic, knowledge-based systems, natural language processing), bottom-up approach of AI techniques (neural networks, evolutionary computing, swarm intelligence), and emerging AI technologies (Brain Computer Interfacing, Ambient AI, Smart City, GPU AI etc).

On successful completion of this unit students will be able to understand the fundamental concepts in artificial intelligence from a theoretical, practical and cognitive point of view, and also gain innovative thought processes to build intelligent systems for future needs. Furthermore, the students can gain hands-on experience in developing intelligent systems using a programming language such as C/C++, C#, Java, Prolog, Lisp, Python, R, or a tool such as Weka, KNIME, MS AzureML, Accord.NET, AForge.NET, Neuroph, tools for NLP (NLTK, AIML), tools for swarm robotics (Microsoft robotics developer studio, Orocos, 'Player Stage Gazebo') etc.

As a result students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Analyse the theoretical foundation of artificial intelligence, current trends and issues to determine the effectiveness of AI technology.
- LO2. Implement an intelligent system using a technique of the top-down approach of AI.
- LO3. Implement an intelligent system using a technique of the bottom-up approach of AI.
- LO4. Investigate and discuss a range of emerging AI technologies to determine future changes in industry.

Essential Content

LO1 **Analyse the theoretical foundation of artificial intelligence, current trends and issues to determine the effectiveness of AI technology**

Philosophical background of AI:

What is an intelligence? How does the brain work? What is artificial intelligence? The Turing test, John Searle's 'The Chinese Room' test, Strong AI vs. Weak AI, Top-down approach of AI vs. bottom up approach of AI.

Top-down approach of AI:

Knowledge-based system, natural language processing, fuzzy logic.

Bottom up approach of AI:

Artificial neural networks, evolutionary computing, swarm intelligence.

Applications of AI:

Intelligent Robot, intelligent agent, artificial life, computer vision, speech recognition, artificial nose, data mining and other smart technologies.

Issues of AI:

Practical difficulties in building brain like machine, ethics and social issues of AI, philosophical issues of AI – will computers control the human?

LO2 **Implement an intelligent system using a technique of the top-down approach of AI**

Choose and develop skill on a development tool or programming language which support top-down approach:

Introduction to the language or tool; a quick tour of the language or tool; investigate and develop skill on functions, classes, libraries and/or packages which support the top-down approach.

Choose a technique from the list below, then investigate and demonstrate the technique using the programming language or a tool:

Knowledge based system: data representation, semantic net, rule-based system.

Fuzzy logic: uncertainty, fuzzy sets, fuzzy inferences, fuzzy rules.

Natural language processing: NLP techniques, parsing with generations, compositional and lexical semantics, dialogues.

LO3 Implement an intelligent system using a technique of the bottom-up approach of AI

Choose and develop skill on a development tool or programming language which support bottom-up approach:

Introduction to the language or tool; a quick tour of the language or tool; investigate and develop skill on functions, classes, libraries and/or packages which support the bottom-up approach.

Choose a technique from the list below then investigate and demonstrate the technique using the programming language or a tool:

Artificial neural network: supervised learning algorithms, single perceptron, MLP & backpropagation learning algorithms.

Evolutionary computing: problem model, fitness evaluation, selection method, crossover operator, evolution scheme, observation.

Swarm intelligence: swarm intelligent approaches, swarm robotics, team size and composition, team configurability, communication pattern and range.

LO4 Investigate and discuss a range of emerging AI technologies to determine future changes in industry

Distributed AI; GPU AI; Ambient AI; Brain Computer Interfacing; Smart Systems, Smart Home and Smart Cities.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction

Unit 26: Machine Learning

Unit 28: Prototyping

Unit code	D/615/1666
Unit level	5
Credit value	15

Introduction

A prototype is the first or early sample, model or demonstration version of a concept, design or idea used to test functionality and gather feedback. The objective of prototyping is to build a functional and demonstrable version of a concept and use this version to evaluate different aspects of the concept with end users. A prototype may test a single or multiple facets of a concept and can range in functionality from very basic design mock-ups to fully functional features within complex software applications.

This unit introduces students to the role, basic concepts and benefits of prototyping in the design and development process of software applications. The aim of this unit is to enhance a student's understanding of the methodology, terminology and benefits of prototyping in the design and development of secure software applications.

Among the topics included in this unit are: classification and terminology of prototyping tools and techniques, the relationship between prototypes and release candidate software applications, how prototypes differ from release candidate software applications, categorising prototypes by their intended target end user, functionality and testing requirements, methods of prototyping, most appropriate forms of prototype for the different categories of testing, gathering meaningful insights and results from prototype testing, software release lifecycle and software prototyping concepts.

On successful completion of this unit students will be able to explain the basic concepts of prototyping; plan, build and measure the success of an appropriate prototype with a specific end user in mind; and conduct testing to gather meaningful feedback and data to improve a prototype or final software application.

As a result they will develop skills such as communication literacy, team working, critical thinking, analysis, reasoning and interpretation, business skills, computer software literacy and language, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Explore forms of prototypes appropriate for various functionality and end user testing requirements.
- LO2. Plan a prototype for specific target end users and planned tests.
- LO3. Develop multiple iterations of the prototype using appropriate tools.
- LO4. Evaluate user feedback and test results from multiple iterations of the prototype and end user testing.

Essential Content

LO1 Explore forms of prototypes appropriate for various functionality and end user testing requirements

Explore formats, characteristics and appropriateness of prototyping:

Present an overview of prototyping, how prototypes are produced and their appropriate use in software development.

Identify what a prototype is by researching the role, purpose, terminology and methodology of prototyping.

Recognise the various forms of prototyping by researching the history of prototyping, current trends and use in the product development lifecycle.

Define the characteristics of a prototype by investigating how they can be used and how they differ from complete applications.

Recognise the use of appropriate prototyping formats to achieve specific end user testing requirements and outcomes.

Recognise specific forms of prototyping functionality and end user testing requirements:

Research, debate and agree current functionality and end user testing trends and appropriate prototyping methodology.

Identify various forms of functionality and end user testing methodology.

Define the advantages and disadvantages of using prototyping to perform end user testing.

Define standard tools available for use in prototyping:

Identify standard tools available to develop prototypes.

The advantages and disadvantages of prototyping tools.

How prototyping tools can be used to rapidly iterate prototypes and capture end user feedback.

Appropriateness of various tools for different end user and functionality testing requirements.

LO2 **Plan a prototype for specific target end users and planned tests**

Identify a specific end user and an appropriate prototyping methodology to test with this user type:

Choose a specific end user to conduct tests against.

Evaluate the benefits, features, advantages and disadvantages of different prototyping methodologies for various end user testing outcomes.

Review different end user categorisations, classifications and behaviour modelling techniques.

Select the most appropriate form of prototyping to achieve desired end user testing and outcomes to ensure the production of a secure end product.

Describe a plan to use appropriate prototyping methodology and tools to conduct end user testing:

Apply end user classification and behaviour modelling to select an appropriate prototyping methodology.

Outline the end user characteristics, desired testing criteria and results your prototype addresses.

Select an appropriate form of prototyping necessary to achieve desired results.

Use your selected end user, appropriate prototyping methodology and desired testing criteria to create a prototyping plan.

LO3 **Develop multiple iterations of the prototype using appropriate tools**

Utilise appropriate tools to develop multiple prototypes:

Employ an appropriate set of tools to develop your plan into a prototype.

Run end user experiments and examine feedback.

Reconcile and evaluate end user feedback and build a new iteration of your prototype modified with the most important feedback and enhancements.

Make multiple iterations of your prototype and modify each iteration with enhancements gathered from user feedback and experimentation.

LO4 Evaluate user feedback and test results from multiple iterations of the prototype and end user testing

Asses the success of your prototype:

Assemble and appraise end use feedback from multiple iterations of your prototype.

Undertake a critical review and compare your final prototype and your test results with the original plan.

Evaluate the advantages, disadvantages, strengths and weaknesses of your prototyping methodology.

Critique the overall success of your prototype and discusses your insight using prototyping.

Application Program Interfaces

Unit code M/615/1669

Unit level 5

Credit value 15

Introduction

Many applications in use today are a composite of other software. This is true of an application, be it web based, mobile or on a desktop where the functionality of another is used to build upon. Think of an application that locates nearby restaurants – this may utilise an already existing map service as its basis. Or a game application that enables players to invite other players, chat and post high scores to social media all within the game environment. How an application interacts with another is through an Application Program Interface (API).

Typically, APIs consist of methods and tools which are developed by the software author and can provide services and functionality to other application developers without having to 'reinvent the wheel'. Existing APIs provide a huge range of functionality which can be integrated into an application by following the rules of the relevant API. One of the benefits in using APIs is access to existing and proven services that can help speed up development and help standardisation.

The aim of this unit is to introduce students to the nature of APIs by developing proof-of-concept application that utilises existing APIs for common tasks that can include communication, displaying interactive visuals, audio playback and handling a range of user inputs.

Among the topics included in this unit are: identifying what an API is and the need for APIs; types of APIs; application design and development utilising relevant APIs in a suitable development environment; testing of the application; and a critical review of the APIs used.

On successful completion of this unit students will be able to identify and select relevant APIs to use within an application of their own choice or from a given scenario, in addition to testing and documenting the review process against the initial design requirement.

As a result students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Examine what an API is, the need for APIs and types of APIs.
- LO2. Apply the knowledge of API research to design an application that incorporates relevant APIs for a given scenario or a substantial student chosen application.
- LO3. Implement an application in a suitable development environment.
- LO4. Document the testing of the application, review and reflect on the APIs used.

Essential Content

LO1 **Examine what an API is, the need for APIs and types of APIs**

Research existing APIs, their role and the need for an API.

Identify types of API uses e.g. visual, social media, device manipulation.

Critically evaluate suitable APIs for use in an application (web/mobile/desktop) for a given scenario or a substantial student chosen application.

LO2 **Apply the knowledge of API research to design an application that incorporates relevant APIs for a given scenario or a substantial student chosen application**

Develop relevant wireframes diagrams, concept the design of the application.

Consider the application design/its purpose.

Consider the target platform (web/mobile/desktop).

Identify the scope of the application.

Justify the selection/relevancy/purpose of the chosen APIs for the application.

Take the security of APIs into consideration.

LO3 **Implement an application in a suitable development environment**

Introduce different types of implementation processes. to extend knowledge and understanding of the stages involved.

Discuss a range of suitable development environments.

Develop the application based on LO2.

Consider the use of a suitable development environment.

Utilise best practices for implementing the application.

LO4 **Document the testing of the application, review and reflect on the APIs used**

Document the testing procedure carried out to satisfy the design requirements/purpose of application.

Review/reflect on the application development process; identifying the chosen APIs strengths weaknesses, ease of use, access to features within the APIs.

Learning Outcomes and Assessment Criteria

Pass		Merit	Distinction
LO1 Examine what an API is, the need for APIs and types of APIs			D1 Evaluate potential security issues surrounding APIs
P1 Examine the relationship between an API and a software development kit (SDK).	M1 Asses a range of APIs for a particular platform that covers a range of uses.		
LO2 Apply the knowledge of API research to design an application that incorporates relevant APIs for a given scenario or a substantial student chosen application			D2 Create a design for a chosen substantial application that will utilise a range of APIs, justifying choices.
P2 Analyse an existing application that could be extended with a suitable API.	M2 Design an application that will utilise an API for a given purpose.		
LO3 Implement an application in a suitable development environment			D3 Construct an application utilising multiple APIs, following the designs in LO2.
P3 Build on an existing application framework to implement an API.	M3 Develop an application that utilises an API.		
LO4 Document the testing of the application, review and reflect on the APIs used			D4 Critically evaluate the APIs used within your application. Provide a data security report of your application.
P4 Design and complete a 'white box' test of the application, recording the results.	M4 Conduct 'black box' tests of your application, recording the results. M5 Update the application accordingly with the results.

Introduction

Software drives business and developers drive software – the world is reliant on software, and programming is at the heart of this. Professionalism and critical thinking, supported by an ability to work independently and as part of a team are core skills of a developer. If you can think logically and you enjoy exploring and dismantling problems, working with others to consider requirements and creating ideas and possible solutions you can gain the experience and learn the skills needed to excel as an Application Developer.

This unit introduces students to Application Development and is designed to simulate the roles and responsibilities of a commercial developer working in a suitable business environment with access to a small team of colleagues. Initially, students are introduced to a business-related problem and will need to adopt and use appropriate methods and practices to analyse, break down and discuss the issues – then, decide, design, create and test a possible solution. Students should be free to debate, evaluate and select different design and development methodologies depending on their own judgement and consideration. On completion, students will be expected to formally evaluate their final application against their design plans and initial requirements.

Among the topics included in this unit are: design and developer documentation; problem analysis; research, system and user requirements; design methodologies and principles; security considerations; development methodologies; Unified Modelling Language (UML), software development lifecycles; teamwork, peer-reviews, development tools and techniques; integrated development environments; debugging, testing, software versions and quality assurance.

On successful completion of this unit students will be able to produce a Software Design Document by analysing a business-related problem and deduce an appropriate solution, including a set of initial requirements, select and use design and development methodologies with tools and techniques associated with the creation of a business application, work individually and as part of a team to plan, prepare and produce a functional business application with support documentation and assess and plan improvements to a business application by evaluating its performance against its Software Design Document and initial requirements.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Produce a Software Design Document by analysing a business-related problem and deduce an appropriate solution including a set of initial requirements.
- LO2. Use design and development methodologies with tools and techniques associated with the creation of a business application.
- LO3. Work individually and as part of a team to plan and produce a functional business application with support documentation.
- LO4. Evaluate the performance of a business application against its Software Design Document and initial requirements.

Essential Content

LO1 **Produce a Software Design Document by analysing a business-related problem and deduce an appropriate solution including a set of initial requirements**

Analyse a business-related problem and assess possible solutions:

Discuss and produce a problem definition statement to highlight and describe the issues that need to be addressed.

Research and consider possible solutions and predict the overall success of the application.

Produce a Software Design Document:

Review and discuss the value of Software Design Documents with regards to application development.

Evaluate your possible solutions and synthesise the ideas into a single document that identifies and attempts to solve the business-related problem.

Research and use information relating to software testing to create a suitable test plan for your business application.

LO2 **Use design and development methodologies with tools and techniques associated with the creation of a business application**

Discuss different design and development methodologies:

Present overviews on current design and development methodologies.

Debate various strengths and weaknesses commonly associated with each methodology.

Select or synthesise a design and development methodology for use with the creation of your application.

Consider the security implications of design and development methodologies.

Use appropriate tools and techniques:

Evaluate different tools and techniques available to create a business application.

Debate the advantages and disadvantages of your preferred or selected tools and techniques.

LO3 Work individually and as part of a team to plan and produce a functional business application with support documentation

Work as a small team to plan and prepare your business application:

Peer-review and debate your development plan by effectively communicating and defending the ideas in your Software Design Document.

Discuss differences with regards to the possible strengths and weakness of each Software Design Document.

Modify your Software Design Document to reflect any new insights or considerations.

Prepare and produce a functional business application:

Use your Software Design Document with your preferred design and development methodology and your selected tools and techniques to develop a functional business application.

Create and quality check appropriate support documents for your application.

LO4 Evaluate the performance of a business application against its Software Design Document and initial requirements

Assess the performance of a business application:

Analyse factors that influence the performance of a business application with regard to its system requirements.

Undertake a critical review of the performance and development of your application against all identified factors and any adopted design and development methodologies.

Measure the overall success of the application against your original prediction and identify any new areas of personal insight.

Plan improvements to a business application:

Evaluate the overall strengths and weaknesses of your business application against its Software Design Document and initial requirements.

Discuss and plan in detail possible revisions (including implementation) with regard to improving your application's performance.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Produce a Software Design Document by analysing a business-related problem and deduce an appropriate solution including a set of initial requirements</p>		<p>LO1 & LO2</p> <p>D1 Justify your solution to a business-related problem and your preferred software development methodology, by comparing between the various software development tools and techniques researched.</p>
<p>P1 Explore a business-related problem and produce a well-defined Problem Definition Statement supported by a set of user and system requirements.</p> <p>P2 Determine any areas of risk related to the successful completion of your application.</p>	<p>M1 Analyse a business-related problem using appropriate methods and produce a well-structured Software Design Document that defines a proposed solution and includes relevant details on requirements, system analysis, system design, coding, testing and implementation.</p>	
<p>LO2 Use design and development methodologies with tools and techniques associated with the creation of a business application</p>		
<p>P3 Research the use of software development tools and techniques and identify any that have been selected for the development of this application.</p>	<p>M2 Compare the differences between the various software development tools and techniques researched and justify your preferred selection as well as your preferred software development methodology.</p>	

Pass	Merit	Distinction

Games Engine & Scripting

Unit code	K/615/1671
Unit level	5
Credit value	15

Introduction

Professional game development typically represents a significant investment in time, effort, skill and money. These requirements are further complicated due to the generally increasing differences in hardware platforms (such as PCs, Mac, Xbox, PlayStation, tablets and other mobile devices). Prior to the use of a games engine, a developer would need highly detailed and specific knowledge relating to the platform, device drivers and operating system calls. In addition, they would need to be capable of writing efficient low-level maths functions to simulate physics, gravity, calculate trajectories and determine object collisions in 2D and 3D environments, including designing image transition algorithms. Using a games engine, a developer can implement more features, more quickly and more effectively, and deploy them on more platforms than ever before. However, despite using a games engine there are still plenty of unique challenges to be solved.

This unit introduces students to the origin and evolution of games engines and their effect on game design, it also expects students to project this path into the future to draw conclusions and predict a possible future for engines. After being introduced to the core services of most engines and their advantages, students are expected to evaluate a range of different engines and debate their features. In addition, and while students assimilate, reflect and consider the advantages and technical challenges of a games engine they will be issued with an existing Games Design Document (supported with all appropriate assets) and challenged with planning and using a specific engine to develop the design into a functional game. On completion, and in addition to the student reviewing and reflecting on the experience, they will be expected to formally assess their functional game against the Games Design Document and user expectation.

Among the topics included in this unit are: games engine evolution and purpose, player expectation, types of engine, design documentation, research, system and user requirements, game design, ad management, monetisation, usage analytics, build services, graphics and animation, adding physics, storing world data, artificial and automated intelligence, collision detection, user interface and user control methods, gameplay, assets and asset management, hardware platforms, development tools and techniques, integrated development environments, scripting languages, debugging, testing, software versions and quality assurance.

On successful completion of this unit students will be able to analyse the evolution, impact and possible future of games engines with regard to game development and expectation, evaluate the features and architecture of different games engines, use an existing Game Design Document (with assets) to synthesise key features of a selected games engine into a playable game and assess and plan improvements to a playable game by evaluating its performance against its Game Design Document and user expectation.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Analyse the evolution, impact and possible future of games engines with regards to game development and expectation.
- LO2. Evaluate the features and architecture of different games engines.
- LO3. Use an existing Game Design Document (with assets) to synthesise key features of a selected games engine into a playable game.
- LO4. Assess and plan improvements to a playable game by evaluating its performance against its Game Design Document and user expectation.

Essential Content

LO1 **Analyse the evolution, impact and possible future of games engines with regards to game development and expectation**

Analyse the evolution of games engines:

Identify what a games engine is by researching the purpose and history of games engines.

Assemble and evaluate a timeline illustrating milestones and linking the release of pivotal games with the development and use of games engines.

Investigate the possible future of games engines with regards to games development and expectation:

Research, debate and agree current gaming trends.

Discuss the evolution of player expectation and its influence and effect on games development.

Analyse trends and use the information to predict a possible future for games (short, mid and long term) and relate this to the development and use of games engines.

LO2 **Evaluate the features and architecture of different games engines**

Features and architecture of a games engine:

Introduce and discuss the core features of games engines, such as: ad management, monetisation, usage analytics, build services, multiplayer support, developer collaboration, debugging, 2D and 3D graphics and animation services, particle and lighting systems, physics and database services, multiple language support, virtual reality, artificial and automated intelligence, collision detection, user interface and user control methods.

Select a specific games engine and discuss game engine architecture, including: game and update loops, assets and memory management, graphics manipulation, scripting, collisions and physics engine, math libraries and user interface.

Evaluate a range of different types of published games to determine and agree the type of features commonly embedded in each.

Use your selected games engine to investigate the implementation and technical challenges associated with each of your previously identified features.

Research different games engines:

Debate the features from a range of games engines and evaluate the strengths and weaknesses of each.

LO3 Use an existing Game Design Document (with assets) to synthesise key features of a selected games engine into a playable game

Synthesise ideas defined in an existing Game Design Document with games engine features:

Evaluate and synthesise an existing Game Design Document with the features of a specific games engine to create a development plan.

Peer-review and discuss your development plan by effectively communicating and defending your ideas and reasoning.

Modify your plan to reflect any new insights or considerations.

Create and test a playable game:

Use the Game Design Document (with assets) with your development plan to create a playable game.

Adopt an appropriate level of testing to identify, debug and fix issues.

LO4 Assess and plan improvements to a playable game by evaluating its performance against its Game Design Document and user expectation

Assess the performance of a playable game:

Analyse factors that influence the performance of a playable game with regard to game genre, style and player expectation.

Undertake a critical review of the performance and development of your playable game against all identified factors, including use of any games engine features.

Critique the overall success of your playable game and identify any new areas of personal insight.

Plan improvements to a playable game:

Evaluate the overall strengths and weaknesses of your playable game against its Game Design Document.

Discuss and plan in detail possible revisions (including implementation) with regard to improving your playable game's performance.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Analyse the evolution, impact and possible future of games engines with regards to game development and expectation</p>		<p>LO1 & LO2</p> <p>D1 Critically analyse each of the games engines evaluated in M3.</p>
<p>P1 Compare different games engines and explain how their evolution has impacted on game design and development.</p>	<p>M1 Discuss the origin, type and chronological evolution of games engines, associating them with influential titles that had a significant impact on video game design and development and explain how this affected player expectation.</p> <p>M2 Provide evidence of current gaming trends and technology and use it to predict the future of games engines and explain how this could affect designers, developers and gamers.</p>	
<p>LO2 Evaluate the features and architecture of different games engines</p>		
<p>P2 Compare the features of different games engines and explain the purpose and operation of each.</p> <p>P3 Review different published games and determine the types of features embedded in each against the features available in a selected games engine.</p>	<p>M3 Evaluate the features and architecture of different games engines and explain with technical detail the purpose and operation of each.</p> <p>M4 Use a selected games engine to create simple prototypes that demonstrate features commonly embedded in games.</p>	

Pass	Merit	Distinction
<p>LO3 Use an existing Game Design Document (with assets) to synthesise key features of a selected games engine into a playable game.</p>		
<p>P4 Use an existing Games Design Document to plan the development and testing of a playable demo and conduct formal peer-reviews regarding your development and testing plan, documenting any feedback given.</p> <p>P5 Use a Games Design Document supported with a development and test plan and a selected games engine to develop a playable demo.</p>	<p>M5 Interpret your peer-review feedback and identify opportunities not previously considered.</p> <p>M6 Extend your playable demo into a game that supports: splash screens, credits, scoring and losing player life.</p>	<p>D2 Further expand your playable game by adding support for: animation, sound, end of level detection, player victory and loss conditions and level restarting.</p>
<p>LO4 Assess and plan improvements to a playable game by evaluating its performance against its Game Design Document and user expectation</p>		
<p>P6 Review the performance of your playable demo or game against the Games Design Document.</p>	<p>M7 Evaluate the strengths and weaknesses of your playable game against player expectation.</p>	<p>D3 Critically evaluate the strengths and weaknesses of your playable game against player expectation and explain opportunities for improvement and further development.</p>

Game Design Theory

Unit code	T/615/1673
Unit level	5
Credit value	15

Introduction

What makes a great game? Although it's easy to say, "This is a great game" when your character has just cleared a zone and your friend's voice buzzes in your headset letting you know that everybody is waiting for you to join the party – then another player interrupts suggesting tactics to take down the next objective. However, it is a completely different story when you (the designer) are sitting, staring at a blank sheet of paper and your producer is expecting you to present 'The next big title'.

This unit introduces students to an exploration of the practices, principles and skills needed to successfully design a game. Initially this unit establishes an overall history of games and reviews how they have (and are still) evolving. It also takes the opportunity to introduce and assess common game features and help the students identify the roles, responsibilities and challenges of game design. As part of this unit students will become familiar with a range of standard documents associated with games design including the 'Game Design Document'. Before students embark on defining, designing and documenting their own game ideas they are given opportunities to work in groups to debate and review the elements of game design, introduced to the design process as well as the practices, principles, tools and techniques. As students progress they are given opportunities to evolve their ideas through peer-reviews before finally presenting a 'High Concept' pitch. To help maximise the student involvement, this unit should (where possible) simulate a real-world, design experience.

Among the topics included in this unit are: design documentation, research, requirement gathering, idea generation, world design, storyboards, storytelling, characters, levels, gameplay, assets and asset management, tools and techniques, game engines and environments, genres, game mechanics, player motivation and challenge, rewards, game structure, game design vocabulary, and preparing and presenting a pitch.

On successful completion of this unit students will be able to critically assess the types, practices, principles and skills used in the design of games, analyse the concepts and elements required for the production of a Games Design Document, evaluate the game design process with regards to game development and production and use game design practices and principles to create an original Game Design Document and present a High Concept pitch.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Critically assess the types, practices, principles and skills used in the design of games.
- LO2. Analyse the concepts and elements required for the production of a Games Design Document.
- LO3. Evaluate the game design process with regards to game development and production.
- LO4. Use game design practices and principles to create an original Game Design Document and present a High Concept pitch.

Essential Content

LO1 **Critically assess the types, practices, principles and skills used in the design of games**

Review game design and game types:

Identify what game design is and explore the evolution of games over time.

Research and assess game types, trends, player features, control and technology.

Investigate the practices, principles and skills used in the design of games:

Identify the role of a games designer and introduce concepts related to the game design process (including high concept, story and art bible, design document).

Discuss idea generation, world design, storytelling, characters, levels, gameplay, assets and asset management.

Assess the skills needed to successfully design a video game.

LO2 **Analyse the concepts and elements required for the production of a Games Design Document**

Investigate Games Design Document structure:

Review different Game Design Documents and identify common and shared factors.

Discuss, compare and synthesise your identified factors into an agreed format.

Analyse the concepts and elements required for a Games Design Document:

Examine the purpose of the Game Design Document (including game loops such as: core, dual and compulsion as well as the principles of Metagame design) and identify the stakeholders and their possible expectations.

Debate the content, depth and quality of information expected in a Games Design Document (including age appropriate content and content ratings).

Explain the strengths and possible weaknesses of a Games Design Document.

LO3 Evaluate the game design process with regards to game development and production

Introduce key terminologies and define a basic roadmap for the game design process (including: concepts, planning and design, development, testing, distribution):

Debate the value of the concept stage (including idea generation and establishing the audience, game world, narrative, style, features and gameplay, characters, storyboards and player motivation and challenges).

Recap why concepts are reviewed, synthesised and stored as a set of documents.

Investigate design tools and explore issues related to the planning and design stage (including: asset creation and management and possible redevelopment of agreed ideas).

Introduce game development constraints (and possible pitfalls) together with platforms commonly available to support development.

Discuss testing methods and introduce the purpose of Quality Assurance (QA) and business and monetisation models (e.g. Steam, retail, Free-to-Play (F2P) supported by techniques such as: item-purchase, affiliate, advertising, Freemium, restricted access, subscription) with regards to production and distribution taking security issues into consideration.

LO4 Use game design practices and principles to create an original Game Design Document and present a High Concept pitch.

Create an original game concept:

Gather and document a range of original game ideas using research on existing game types and styles for inspiration.

Peer-review and evaluate feedback on a number of your game ideas to justify the selection of a specific game idea.

Review and apply game design practices and principles to develop a specific game idea into a full, well-structured concept.

Create an original Game Design Document and present its High Concept pitch:

Produce and quality check a Game Design Document and High Concept presentation based on your selected concept.

Present and defend your High Concept pitch.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Critically assess the types, practices, principles and skills used in the design of games</p>		<p>LO1 & LO2</p> <p>D1 Evaluate each section of a Games Design Document and explain the effect of game loops and Metagame design with regards to game play.</p>
<p>P1 Compare different video game types and explain key or influential titles as they were released over time.</p> <p>P2 Research the skills needed to design, create and produce a video game and compare the roles of a games animator, producer, audio engineer, director, designer, programmer and artist.</p>	<p>M1 Analyse the evolution of game technology and its impact on video game design and complexity.</p>	
<p>LO2 Analyse the concepts and elements required for the production of a Games Design Document</p>		
<p>P3 Examine the structure of a Game Design Document.</p>	<p>M2 Determine the various needs and expectations of the Game Design Document stakeholders.</p>	

Pass	Merit	Distinction
<p>LO3 Evaluate the game design process with regards to game development and production</p>		<p>D2 Evaluate the importance and issues related to idea generation, audience understanding, world design, narrative, style, features, gameplay, characters, storyboards and player motivation and challenge with regards to game design.</p>
<p>P4 Create an illustrated guide explaining the video game design, development and production processes, including an evidence-based comparison between 'AAA' and 'Indie' (independent) budget allocation and development timelines.</p> <p>P5 Compare different business and monetisation models used with games production and distribution.</p>	<p>M3 Review different game distribution channels and marketing methods used in games production.</p>	
<p>LO4 Use game design practices and principles to create an original Game Design Document and present a High Concept pitch</p>		<p>D3 Critically evaluate the strengths and weaknesses of your finished video game concept, Design Document and High Concept pitch and fully justify opportunities for improvement and further development.</p>
<p>P6 Create an original game concept and maintain organised evidence of giving appropriate and constructive feedback to others.</p> <p>P7 Develop an original Game Design Document and High Concept presentation.</p>	<p>M4 Conduct peer-reviews using your original game concept and document any feedback given.</p> <p>M5 Develop a detailed, original Game Design Document and formally present and defend your High Concept pitch.</p>

Analytical Methods

Unit code	F/615/1675
Unit level	5
Credit value	15

Introduction

John von Neumann, a Hungarian mathematician, outlined the architecture for a stored-program computer in a paper he wrote in 1945. In order to fully develop new software and hardware technologies within this architecture, analytical skills and techniques needed to be applied to any proposed design. In the modern era, analytical methods still underpin theoretical computer science fundamentals, and developing this mathematical knowledge will support development in many aspects of computing.

This unit introduces students to more advanced analytical techniques that are relevant to them as they progress within their studies in computing, and advances knowledge of mathematical modelling and application of theory.

Among the topics included in this unit are: complex numbers, numerical methods, matrices, formal logic and Z specification.

On successful completion of this unit students will be able to use applications of complex number theory, approximate solutions of contextualised examples with numerical methods, apply matrix theory to a variety of different scenarios and use formal methods of logic. As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Examine complex number theory within practical situations.
- LO2. Approximate solutions using numerical methods.
- LO3. Employ matrix methods to contextualised examples relevant to computing.
- LO4. Investigate the concepts of formal methods within computer science.

Essential Content

LO1 Examine complex number theory within practical situations

Complex number theory:

Introduction to imaginary numbers and complex numbers.

The modulus, argument and conjugate of complex numbers.

The polar form of complex numbers.

The use of de Moivre's Theorem.

Using quaternions for spatial rotation in computer graphics.

LO2 Approximate solutions using numerical methods

Numerical methods:

Using sketches to approximate solutions of equations.

Numerical analysis using the bisection method and the Newton–Raphson method.

Numerical integration, the trapezium rule and Simpson's rule.

Analysis:

Error analysis to determine the accuracy of approximations.

Explanation of numerical method failure and comparison of methodology.

LO3 Employ matrix methods to contextualised examples relevant to computing

Matrix methods:

Introduction to matrices and matrix notation.

Using matrices to represent ordered data and the relationship with program variable arrays.

The process for addition, subtraction and multiplication of matrices.

Calculating the determinant and inverse of a matrix.

Application of matrices to vector transformations and rotation, maps and graphs.

LO4 Investigate the concepts of formal methods within computer science

Formal reasoning:

Logic and proof.

Introduction to Hoare logic.

Hoare logic to assess the correctness of computer programs.

Automated proof checking.

Z specification language:

Model-based specification.

The modelling of software systems using Z specification.

Proving properties using Z specification.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Examine complex number theory within practical situations		D1 Formulate solutions of problems using de Moivre's Theorem.
<p>P1 Solve applicable problems using complex number theory.</p> <p>P2 Perform arithmetic operations using the polar and exponential form of complex numbers.</p>	<p>M1 Critique the use of quaternions for application in spatial rotation.</p>	
LO2 Approximate solutions using numerical methods		D2 Appraise the different methodology that is used for numerical integration.
<p>P3 Examine the roots of an equation using two different iterative techniques.</p> <p>P4 Determine the numerical integral of functions using two different methods.</p>	<p>M2 Select two different examples that show the failure of numerical techniques.</p>	
LO3 Employ matrix methods to contextualised examples relevant to computing		D3 Determine solutions to a set of linear equations using the inverse matrix method.
<p>P5 Utilise matrices to represent ordered data in array form.</p> <p>P6 Perform addition, subtraction and multiplication of matrices.</p>	<p>M3 Ascertain the determinant of two different scale matrices.</p>	
LO4 Investigate the concepts of formal methods within computer science		D4 Judge the correctness of a given computer program using Hoare logic.
<p>P7 Interpret the meaning of given logical statements into plain English.</p> <p>P8 Examine the modelling of software systems using Z specification.</p>	<p>M4 Use Hoare's notation to model the correctness of a given computer program.</p>

Systems Analysis & Design

Unit code	L/615/1677
Unit level	5
Credit value	15

Introduction

The world is constantly changing, with new and emerging digital technologies bringing many challenges to the commercial world. Organisations have to respond to these changes in addition to responding to new markets and different ways of doing their business. The systems they use to run their businesses have to respond quickly to these transformations. Organisations can find themselves in a situation where they have to regularly upgrade old systems or develop new ones in order to continue operating successfully in the evolving competitive business environment.

Before any system can be upgraded or a new system developed, the system requirements have to be analysed and the system designed, whether this is for a database system, or a web, game or mobile application, and failure to do this adequately could lead to a costly systems failure.

This unit explores the processes of systems analysis and design using two methodologies – the traditional systems development lifecycle methodology providing a comprehensive structured framework and the agile methodology with different framework models developed with the emphasis on variations of iterative incremental modelling. To provide perspective, students will examine the models in both these methodologies. They will consider the particular strengths and weaknesses of the two methodologies and examine the suitability of the methodologies using different examples.

Topics included in this unit are: examining the business case for a new system or for upgrading an existing one, looking at traditional and agile systems analysis methodologies and evaluating the merits of each, considering the implications of moving from using the traditional methods of analysis and design to agile methods on analysts, designers and developers in an organisation, and applying systems design tools and techniques.

On successful completion of this unit, students will be able to produce a business case, and analyse a system and its requirements using a suitable methodology. They will be able to design a system suitable for their application. Theoretical understanding will be translated into practical skills through actual systems investigations and students will become confident in the use of particular tools and techniques relevant to the methodology chosen. Although for practical purposes, it is likely that one particular methodology and related tools and techniques will be used, it is important that students understand that others are available.

As a result students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of the unit students will be able to:

- LO1. Evaluate the strengths and weaknesses of the traditional and agile systems analysis methodologies.
- LO2. Produce a feasibility study for a system for a business-related problem.
- LO3. Analyse their system using a suitable methodology.
- LO4. Design the system to meet user and system requirements.

Essential Content

LO1 **Evaluate the strengths and weaknesses of the traditional and agile systems analysis methodologies**

Principles of the traditional Systems Development Life Cycle (SDLC) models, including Waterfall, Prototyping, and Spiral.

Principles of agile methodologies models, including Scrum, Extreme, Lean, Scaled Agile Frameworks (SAFe), Disciplined Agile Delivery (DAD), Kanban, Disciplined Agile Delivery (DAD), Agile Modelling (AM) and DevOps, amongst the many variations.

Strengths and weaknesses of traditional and agile methodologies.

Identify transition problems in organisations of moving from traditional to agile methodology.

Factors that need to be considered when selecting the appropriate methodology to use.

LO2 **Produce a feasibility study for a system for a business-related problem**

Elements of a business case to explore both business and technical feasibility options.

Desirability, viability and feasibility of systems.

Investigation techniques to use.

Criteria to consider for a business case: vision and goals cost-benefit analysis, legal, economic, technical, operational, timeframes, organisational culture, security considerations.

LO3 **Analyse their system using a suitable methodology**

Tools used to investigate the system.

Identifying user and system requirements and any constraints, including possible security issues.

Identifying the team members and their roles and responsibilities in a project team.

Identifying documentation that will be produced at the different stages and determining the sign-off conditions.

Criteria to use to determine the suitability of the methodology used to analyse the system.

LO4 Design the system to meet user and system requirements

Design elements for the traditional and agile methodologies.

Determining the design features for traditional and agile methodologies.

Data flow diagrams and flow charts.

Determining the tools and techniques relevant for the design of systems for database applications, web applications, games, mobile applications and other software applications.

Identifying the design documentation contents for different application types e.g. for databases, web design, games, mobile and other software applications.

Link to other units relevant for students where systems are being designed and developed.

Design sign-off.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Evaluate the strengths and weaknesses of the traditional and agile systems analysis methodologies		LO1 & LO2 D1 Critically evaluate the strengths and weaknesses of the traditional and agile methodologies and feasibility study.
P1 Discuss the strengths and weaknesses of the traditional and agile systems analysis methodologies.	M1 Compare and contrast the strengths and weaknesses of the traditional and agile systems analysis methodologies.	
LO2 Produce a feasibility study for a system for a business-related problem		
P2 Produce a feasibility study for a system for a business related problem.	M2 Evaluate the relevance of the feasibility criteria on the systems investigation for the business related problem.	
LO3 Analyse their system using a suitable methodology		LO3 & LO4 D2 Justify the choice of the methodology used in the context of the business problem.
P3 Review a system using a suitable methodology for a business-related problem.	M3 Analyse the effectiveness of the methodology used in providing a solution for a given business context.	
LO4 Design the system to meet user and system requirements		
P4 Design a fully functional system to meet user and system requirements for the business related problem.	M4 Assess the effectiveness of the system design with particular reference to the methodology used and how the design meets user and system requirements

Unit 6: Managing a Successful Computing Project

Unit 9: Software Development Lifecycles

Unit 35: Network Management

Unit code	Y/615/1679
Unit level	5
Credit value	15

Introduction

Network Management has become one of the most sought-after skills for government institutions, commercial organisations, financial institutions as well as academic institutions as they try to run their IT networks in a more cost effective, efficient and secure way. The art of Network Management needs to be perfected by those in charge of networks for today and the future. This includes multimedia applications such as VoIP, IPTV and mobile network as well as virtualised environments.

This unit introduces students to simple network Planning, Configurations, Setup, and Management, including LAN, WAN, NAT, PAN, MAN, using a variety of tools and methods for managing Networks, including Network Monitoring, Network Security such as Snort, Firewalls & IPS, Network Protocols and standards such as SNMP, NETCONF, IEEE, MIBII, RMON, MDIB & ANS.1, as well as industry's best practices. Students will also be introduced to Virtual Networks, Network Operating Systems, Risk Management and Cloud Network Management.

Among the topics included in this unit are: Network Planning, Network Configurations, Network Setup and Network Management of LANs, PAN, MAN, WAN, NAT using several tools and methods; Network Monitoring, Network Security, Network Load Balancing, Network Protocols and Standards, Best Practices, Virtualisation, Network Operating Systems, Network Risk Management and Cloud Network Management.

On successful completion of this unit students will be able to plan a network, configure a network, setup a network, manage a network such as a LAN, PAN, MAN, WAN as well as conduct network monitoring, Network Security, network protocols and standards. Students will also be able to apply industry best practices, manage virtualised networks, work with several operating systems vendors and well as plan and manage network risks and cloud computing.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Explore the concepts and principles of Network Management.
- LO2. Plan, Design, Setup and Configure a network.
- LO3. Justify the Protocols and Standards concerned with Networking and Network Management.
- LO4. Use tools and methods to manage a network, including Network Security and Risk Management.

Essential Content

LO1 Explore the concepts and principles of Network Management

Describe effective network management activities, security, networking technologies, networking topologies, networking protocols, self learning networks, Service Level Agreements (SLAs).

LO2 Plan, Design, Setup and Configure a network

Planning and Design:

Planning methodology, topological design, protocols, transmission technologies, hardware, network realisation.

Setup and Configuration:

Devices, cabling, protocols, ACLs, security.

LO3 Justify the Protocols and Standards concerned with Networking and Network Management

Network Protocols and Standards:

Protocols: SNMP, NTP, NETCONF, RMON, TCP/IP, HTTP, DNS, DHCP, SSL, IPSec.

Standards: IEEE, ITU, ISO, OSI, IANA.

LO4 Use tools and methods to Manage a Network including Network Security and Risk Management

Tools and methods:

NETCONF, CISCO, SNMP, RMON.

Network Security:

IPSec, GRE (Genetic Routing Encapsulation), HHTPs, FTPs, DNS, Firewall, Passwords, Cryptography.

Risk Management:

Risk Identification, Risk Mitigation, Risk Avoidance, Risk Management.

Learning Outcomes and Assessment Criteria

Pass		Merit	Distinction
LO1 Explore the concepts and principles of Network Management			LO1 & LO2 D1 Provide a comprehensive network configuration by providing screenshots of your work.
P1 Investigate Network Management concepts and principles.	M1 Evaluate the importance of Network Management.		
LO2 Plan, Design, Setup and Configure a network			
P2 Produce a comprehensive design of a network according to a given scenario.	M2 Implement a network design according to a predefined network specification.		
LO3 Justify the Protocols and Standards concerned with Networking and Network Management			D2 Evaluate the role and functions of SNMP and RMON.
P3 Assess the following Network Protocols and Standards: SNMP, NETCONF, RMON, TCP/IP, HTTP, DNS, DHCP, SSL, IPsec, IEEE, ITU, ISO, OSI including IANA and ICANN.	M3 Analyse the benefits and limitations of two Protocols.		
LO4 Use tools and methods to manage a network, including Network Security and Risk Management			D3 Critically evaluate the importance of carrying out a Risk Assessment on a network.
P4 Use tools and methods to manage a network.	M4 Justify the importance of Network Security in a network.		
P5 Implement Network Security on your network. P6 Conduct a Risk Assessment on your network.

Unit 36: Client/Server Computing Systems

Unit 36:

Client/Server Computing Systems

Unit code	L/615/1680
Unit level	5
Credit value	15

Introduction

The client/server system is a distributed application structure that partitions tasks or workloads between the providers of a resource or service (called servers) and service requesters (called clients). It is the basis of most internet communication. When surfing the internet, sending/receiving emails, using VoIP software and other applications, these functions work by using client/server systems.

This unit introduces students to the client/server system, an exchange mode for different applications. It consists of communication processes between clients and servers, the operation of applications based on the client/server system, and the socket programming used to code the system.

Among the topics included in this unit are: an introduction to the internet (concept, history, operation), client/server systems, various application protocols based on client/server systems, an introduction to Linux, client/server system programming, security considerations.

On successful completion of this unit students will be able to demonstrate an understanding of the concepts of servers, clients, and processes; illustrate different application protocols based on a client/server model (such as the meaning of http in a website address, POP/IMAP in email); reconstruct a client/server model in Linux systems.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competences.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Explore the concepts of servers, clients, and processes and the differences between PPID and PID.
- LO2. Analyse the communication processes between clients and servers in different application protocols with records captured from the internet.
- LO3. Create a client/server model in a Linux system with User Datagram Protocol (UDP), Transmission Control Protocol (TCP) and Application Layer protocols.

Essential Content

LO1 **Explore the concepts of servers, clients, and processes and the differences between PPID and PID**

Introduction to the structure of Open Systems Interconnection model (OSI model) and the operation of Transmission Control Protocol/Internet Protocol (TCP/IP).

Basic concepts of client, server, process.

Introduction to the concept and function of Sockets Interface.

The communication process between servers and clients (e.g. echo server process).

Measures to ensure server security.

LO2 **Analyse the communication processes between clients and servers in different application protocols with records captured from the internet**

Typical internet applications.

The concept, function, communication process based on the client/server system, and applications of following protocols:

Domain Name System (DNS).

Dynamic Host Configuration Protocol (DHCP).

Remote Interactive Computing: TELNET/ Secure Shell (SSH).

Email: Simple Mail Transfer Protocol (SMTP)/ Post Office Protocol (POP)/Internet Message Access Protocol (IMAP)/ Multipurpose Internet Mail Extensions (MIME).

File Transfer and Access: File Transfer Protocol (FTP)/ Trivial File Transfer Protocol (TFTP)/ Network File System (NFS).

World Wide Web: Hypertext Transfer Protocol (HTTP).

Network Management: Simple Network Management Protocol (SNMP).

Introduction to the Wireshark:

Function, history, install Wireshark, interface, and operation.

LO3 Create a client/server model in a Linux system with User Datagram Protocol (UDP), Transmission Control Protocol (TCP) and Application Layer protocols

Introduction of Linux:

Introduction to the Linux system: concept, history, advantages and disadvantages.

Basics–Linux command, the way to compile, the debugging method.

Programming of client/server program:

Socket Programming in Linux, including socket operation, byte order operation, address formats conversion, socket option, name and address operation, secure coding.

Simple UDP client / server program: UDP-based socket API, UDP-based client, UDP-based server.

Simple TCP client / server program: TCP-based socket API, TCP-based client, TCP-based server.

Application programming, such as a DNS server/client system.

Credit value	15

Introduction

The aim of this unit is to provide students with knowledge about computer systems, functionality and organisation. Systems architecture and elements of computing machines will be examined and the principles and fundamentals of how computer systems work. Computer architecture engineers work in industries such as telecoms, automotive and aerospace.

This unit introduces students to the hardware and software architecture of computer systems and low-level language program development using CPU registers to manipulate data. Students will explore how program instructions and data types can be represented, stored in a computer system and used to carry out a computing task.

Among the topics included in this unit are: computer architecture elements, CPU instruction sets, fetch-execute cycle, CPU registers, binary calculations, use of PC and stack, reading/writing to peripherals, architectural security aspects including protected memory segmentation and synchronous/asynchronous channel I/O operations, parallel machines, emerging computer architectures and security considerations.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of the unit students will be able to:

- LO1. Examine the functions of computer system components.
- LO2. Discuss how data and programs can be represented within computer systems.
- LO3. Demonstrate the principles of processor operations.
- LO4. Investigate advanced computer architectures and performance.

Essential Content

LO1 Examine the functions of computer system components

Component functions:

Logical/physical component functions; Clock Synchronisation; Processor (CPU), buses, memory maps and IRQ; Boolean logic gates; adder circuits; analysis of how components interact to carry out the fetch-execute cycle and modify data; definition and use of CPU registers. I/O device memory.

LO2 Discuss how data and programs can be represented within computer systems

Data/program representation:

Program/data representation and storage; description, use and storage of data types integer, decimal and character; absolute/relative program location; firmware/software.

LO3 Demonstrate the principles of processor operations

Principles of processor operations:

Low-level program instruction sets; RISC; development of assembler programs (including at least 1 JMP instruction) to manipulate stored data using CPU registers; I/O memory and IRQ locations.

LO4 Investigate advanced computer architectures and performance

Advanced Architectures:

Advanced Architectures; MIMD parallelism (Flynn's Taxonomy), Cache, instruction/graphics pipelining; unconventional architectures; benchmarking; functional unit mix, IRQ latency.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Examine the functions of computer system components		D1 Evaluate through illustration how the processor is physically connected to memory and input/output (I/O) devices using the system buses.
P1 Investigate the key computer system components and how they interact. P2 Show how the different types of memory can be attached to a processor.	M1 Compare the roles played by different types of memory.	
LO2 Discuss how data and programs can be represented within computer systems		D2 Evaluate how locating a program absolutely in memory can aid ICE target system debugging.
P3 Investigate, using examples, how different types of data can be converted and stored in computer systems. P4 Carry out Boolean logic operations.	M2 Show how, using examples, floating point numbers can be represented in binary form. M3 Illustrate how adder circuits are used to add binary numbers.	

Pass	Merit	Distinction
LO3 Demonstrate the principles of processor operations		D3 Examine how the width of the data bus and address bus affect processor performance and complexity.
<p>P5 Illustrate the use of the different processor registers in the fetch execute cycle.</p> <p>P6 Illustrate, with an example, how polling and interrupts are used to allow communication between processor and peripherals.</p>	<p>M4 Create a low-level program which includes decision making, branching and I/O operations.</p> <p>M5 Investigate the function of an interrupt handler.</p>	
LO4 Investigate advanced computer architectures and performance		D4 Critically evaluate, with illustrations, computer performance improvements with MIMD architectures.
P7 State the function of DirectX API, describing its advantages and disadvantages.	<p>M6 Assess how instruction pipelining modifies the performance of a computer system.</p> <p>M7 Evaluate how the DirectX API is used by application programmers to control graphics functions.</p>

Database Management Systems

Unit code	Y/615/1682
Unit level	5
Credit value	15

Introduction

As globalisation and the 24-hour economy develop and increase, organisations must ensure that their database management systems (DBMS) are reliable, secure, efficient and able to cope with rapid change. Database management systems will continue to service the many operations of our modern world; they are becoming increasingly complex, to develop and manage, due to technological advancements and changes in the way organisations do their business in a global market.

In this unit, students will examine the structure of data, and how an efficient data design follows through into an effectively developed database management system. Students will examine the merits of different DBMS platforms, and investigate system administration and management tools of the platform.

Amongst the topics included in this unit are: examination of different database management systems, database design tools and techniques of relational database management systems, using an open source platform to develop, test and manage a client's system.

On successful completion of this unit students will be able to demonstrate their knowledge of the fundamentals of database management systems, be able to make informed choices between vendor and open source platforms for database management systems, design and develop a relational DBMS for a client using an open source platform, and carry out system administration tasks.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Analyse different types of database management systems.
- LO2. Design a database management system using a relational model to meet client requirements.
- LO3. Develop a database management system using a suitable platform.
- LO4. Demonstrate the system administration and management tools available on the chosen platform

Essential Content

LO1 **Analyse different types of database management systems**

Types of database management systems (DBMS) and their operating system support, e.g. MySQL, Oracle.

Data models: Entity-Relationship, relational, hierarchical, network, object-oriented, object-relational.

Examine details of DBMS based on a relational model.

Relational data structures, including: relations, attributes, domain, tuple, cardinality.

Constraints: key, domain, referential integrity.

Normalisation in developing efficient data structures.

Modelling languages: query language, data definition language (DDL), data, manipulative language (DML), relational languages.

Transaction and concurrency in DBMS.

Investigation of open source and vendor-specific systems.

Multiple platform approaches to database management.

LO2 **Design a database management system using a relational model to meet client requirements**

Determine user and system requirements.

Examine design tools and techniques for a relational database management system.

Physical system design.

Logical design: design for relational databases, tables, data elements, data types, keys and indexes, entity relationship modelling, data flow diagrams, flowcharts.

Mathematical relations e.g. relational algebra, relational calculus.

DBMS selection, e.g. MySQL.

Application design, including: data entry/input (verification, validation, calculated fields, masks, directed input), reports (queries, presentation of data, layouts), task automation (imports, updates, deletions), queries using multiple criteria, form values and wild cards, action queries, calculated queries, queries across multiple tables.

Hardware, software and other resource requirements.

Test plans to check correctness of data, security, functionality, accessibility and usability.

Quality, effectiveness and appropriateness of the solution: correctness of data, relationships between data, data integrity, normalisation.

Working with clients and others to improve the quality, effectiveness, security and appropriateness of solution design

LO3 Develop a database management system using a suitable platform

Use of an appropriate database management system and Structured Query Language (SQL) to produce a secure solution to meet client's requirements.

Creating, setting up and maintaining data tables.

Applying data validation rules.

Generating outputs e.g. user-generated queries, automated queries, reports.

Application and user interface e.g. navigation, data entry forms and sub-forms, automated functions.

Populating the database.

SQL statements to extract, manipulate and modify data.

Applying security measures to control access to data, e.g. user access levels.

Testing the database solution using different types of testing: referential integrity, functionality, security, stability.

Selection and use of appropriate test data.

Selecting suitable test users and gathering feedback from users.

Making use of testing outcomes to improve and/or refine the solution.

Reviewing the solution, criteria for use when reviewing the solution against: quality of the database, fitness for purpose, suitability against the original requirements, technology constraints, strengths and improvements, platforms and compatibility.

Optimising the solution: data types, data sizes e.g. size on disk, many tables e.g. overheads for many tables, query optimising.

LO4 Demonstrate the system administration and management tools available on the chosen platform

Describe core database administration tasks and tools.

Practical demonstrations of server management to include:

Setting up and managing data storage for servers and users.

Backup and recovery routines for data and applications.

Managing authorisations.

Managing security and encryption.

Importing and exporting data.

Trace database activity.

Monitoring performance and optimising performance.

Audit trails.

Managing alerts and notifications.

Database maintenance including setting up automatic routines.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Analyse different types of database management systems		D1 Critically evaluate different database management systems available in relation to open source and vendor-specific platforms, justifying the criteria used in the evaluation.
P1 Compare and contrast the different types of database models.	M1 Assess how relational database models and the process of normalisation can provide reliable and efficient data structures.	
LO2 Design a database management system using a relational model to meet client requirements		LO2 & LO3 D2 Critically evaluate the effectiveness of the system design and development against client and system requirements.
P2 Produce a design for a relational database management system to meet client requirements.	M2 Analyse how the design will optimise system performance.	
LO3 Develop a database management system using a suitable platform		
<p>P3 Develop a fully functional system which meets client and system requirements, using an open source language (with an application software e.g. MySQL with front end Microsoft Access).</p> <p>P4 Test the system for functionality and performance.</p>	M3 Implement effective features in the solution to handle concurrency, security, user authorisations and data recovery.	

Pass	Merit	Distinction
<p>LO4 Demonstrate the system administration and management tools available on the chosen platform</p>		
<p>P5 Demonstrate the tools available in the system to monitor and optimise system performance, and examine the audit logs.</p> <p>P6 Demonstrate the tools available in the system to manage security and authorisations.</p>	<p>M4 Assess the effectiveness of the system administration and management tools available on the platform identifying any shortcomings of the tools.</p>	<p>D3 Analyse any future improvements that may be required to ensure the continued effectiveness of the database system.</p>

Unit 39:

E-Commerce & Strategy

Unit code	D/615/1683
Unit level	5
Credit value	15

Introduction

Electronic Commerce, or E-Commerce, refers to any type of commercial/business transaction where information, data, products and services are exchanged across the internet. These transactions can cover a wide diversity of business types to include: consumer-based retail sites (e.g. Amazon), sites that provide facilities such as auctions (e.g. eBay) and business exchanges between different organisations. E-Commerce allows consumers to electronically exchange goods and services 24/7 with no barriers in terms of time or geography.

Within this unit students will gain an understanding of how and why businesses and organisations develop E-Commerce strategies: to remain competitive in the global market. Students will also appreciate the elements and resources required to set up an E-Commerce site and be engaged in the design and implementation of their own strategies that would in reality form part of a secure E-Commerce site.

Students will examine the impact that E-Commerce has on society and the global market for consumers, buyers and sellers in terms of the benefits and drawbacks of online purchasing. Through investigation, students will also research the technologies involved in setting up a secure E-Commerce site in preparation for their own E-Commerce strategy.

There is an expectation that students will devise a strategy based on an element of E-Commerce such as designing a shopping cart, an ordering system, payment system or an online marketing system, for example. This design should be fully implemented and evaluated accordingly in terms of its success or failure.

Standards and levels of support, marketing, CRM, promotion and supply chain management will all be explored within the context of developing the implementation strategy.

On successful completion of this unit a student will have gained both a technical and practical insight into E-Commerce strategy, design and development. As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Examine the strategies employed and the impact of E-Commerce on business organisations.
- LO2. Analyse the hardware, software, web-based and database technologies involved in setting up a secure E-Commerce site.
- LO3. Design an E-Commerce strategy based on a given end user requirement or specification.
- LO4. Implement an E-Commerce strategy based on a given end user requirement or specification.

Essential Content

LO1 Examine the strategies employed and the impact of E-Commerce on business organisations

Customer expectations:

Raised expectations for a quick and efficient service e.g. timely responses to customer communications, quick delivery of the product or service, accurate information, reduced pricing for the product/service, greater choice.

Benefits:

Wider market, niche target marketing, lower overheads and costs, greater flexibility and access to goods/services 27/7.

Drawbacks:

Visibility, security issues and threats, down-time, high set up and maintenance costs, need to employ a technician or web-based administrator to manage the provision.

LO2 Analyse the hardware, software, web-based and database technologies involved in setting up a secure E-Commerce site

Web architecture:

Components e.g. server-side scripting, client/server/script interaction, operation of server-side web applications, accessing data on the web server, dynamic web pages, consistent navigational menu on all pages, browser cookies, embedding animation and video content in web pages, adding interactivity with plug-ins.

Hardware and software:

Web servers, browsers, server software, web authoring tools, database system, shopping cart software, scripting software, browser and platform compatibility. Networking technology e.g. TCP/IP addresses, ports and protocols; domain names, multiple registration of domains (.com as well as .co.uk); setting up the server directory structure, deploying access configuration/security.

Database technology:

Uses and processes e.g. database-driven web pages, opening a connection to a database, storing data captured from forms, performing dynamic queries on the database, generating a web page response displaying the results of a query.

Communication technology:

Uses e.g. email support, forum; search engine optimisation; additional hardware and software components required to support communications.

Data transmission:

Features e.g. download speeds, transfer rates, bandwidth required for given applications including text, graphics, video, speech.

LO3 Design an E-Commerce strategy based on a given end user requirement or specification

Considerations:

Hardware and software, design and development, costs and resources, security, maintenance, customer online support and logistics.

Internet strategy:

Hosting e.g. internal, sub-contracted; design of the website; maintaining 24/7 access.

Marketing strategy:

Methods e.g. targeting market segments and interest groups, developing electronic 'web-communities', CRM, promotion strategies to target specific market segments, search engine optimisation, e-marketing software.

Supply chain strategy:

Methods e.g. satisfying customer demand, responsive supply chain, managed in house or sub-contracted, developing 'partnership' relationships with suppliers.

Electronic payment:

Methods e.g. online transaction processing, Commercial Off the Shelf Software (COTS), other payment systems e.g. PayPal, WorldPay.

LO4 Implement an E-Commerce strategy based on a given end user requirement or specification

Implementation:

Demonstrate that the E-Commerce strategy devised has been implemented using suitable tools and applications. The strategy could be marketing, supply chain or payment based, for example designing an online ordering system or an online payment system.

Evaluation:

Evaluate the success of the design and implementation of the E-Commerce strategy.

Technique:

SWOT analysis to evaluate the overall strengths, weaknesses, opportunities and threats of the implemented E-Commerce strategy.

Learning Outcomes and Assessment Criteria

Pass		Merit	Distinction
LO1 Examine the strategies employed and the impact of E-Commerce on business organisations			D1 Critically review the benefits and drawbacks of an organisation utilising E-Commerce.
P1 Discuss the importance of addressing and meeting customer expectations when employing an E-Commerce strategy.	M1 Analyse organisation case studies and examine how E-Commerce has been used to improve an element of business operations.		
LO2 Analyse the hardware, software, web-based and database technologies involved in setting up a secure E-Commerce site			D2 Evaluate the role that database technology plays in the development and sustainability of E-Commerce.
P2 Discuss the technologies involved in setting up a secure E-Commerce site.	M2 Justify the importance of communications technology in E-Commerce design.		
LO3 Design an E-Commerce strategy based on a given end user requirement or specification			D3 Appraise the design and functionality of the E-Commerce solution.
P3 Discuss the types of strategies that could be used to drive an E-Commerce solution.	M3 Analyse the factors and resources that should be considered when designing an E-Commerce strategy.		
P4 Design an E-Commerce solution based on a specified requirement or strategy.	M4 Differentiate between the types of payment systems that are integral to E-Commerce success.		

Pass	Merit	Distinction
LO4 Implement an E-Commerce strategy based on a given end user requirement or specification		
P5 Implement an E-Commerce solution based on a specified requirement or strategy.	M5 Produce a detailed SWOT analysis to support the implemented E-Commerce design.	D4 Evaluate the success of the E-Commerce implementation and identify how it fulfils a specified requirement or strategy.

Unit 40:

User Experience and Interface Design

Unit code	H/615/1684
Unit level	5
Credit value	15

Introduction

User Experience (UX) and User Interface (UI) Design is the process by which software applications and user interactions can be designed to be simple, accessible, effective and attractive for the end user. The objective of UX and UI Design is to create user interactions and software application experiences that are appropriate for specific platforms or devices and provide desirable end user outcomes utilising insight and understanding about the practical, emotional and experiential motivations and values of the end user. UX and UI Design explores the motivations and desires of the end user and seeks to design user's interactions that best satisfy those motivations and desires in a concise manner.

This unit introduces students to the role, basic concepts and benefits of UX and UI Design in the development process of software applications. The aim of the unit is to enhance the student's understanding of the methodology, terminology and benefits of UX and UI Design in the development of software applications.

Among the topics included in this unit are: classification and terminology of UX and UI Design techniques, the relationship between UX and UI Design, how UX and UI Design relates to the rest of the software development lifecycle, understand a user's emotions, desires and attitudes about using a particular feature, product, system, platform or software application, modes of interaction, human-computer interaction models, usability, accessibility, aesthetics, design thinking, value proposition design, user journey mapping and gathering meaningful insights from users feedback and research.

On successful completion of this unit students will be able to explain the basic concepts of UX and UI Design. Plan, build and measure the success of an appropriate UI Design. Design an interface and experience with a specific end user in mind. Conduct testing to gather meaningful feedback to evaluate the success or failure of a user interface. As a result they will develop skills such as communication literacy, design thinking, team working, critical thinking, analysis, reasoning and interpretation, computer software literacy which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Research what aspects of User Experience and Interface Design are necessary and appropriate to satisfy end user emotions, desires and attitudes when using a user interface concept.
- LO2. Plan an appropriate User Experience map and Interface Design for a User Interface concept with a specific target end user in mind and also outline the tests you mean to conduct.
- LO3. Build a User Interface concept and test it with users to see if it satisfies their emotions, desires and attitudes as planned.
- LO4. Evaluate user feedback, test results and insights gained from end users interacting with your User Interface concept to determine success or failure and steps to improve in future versions.

Essential Content

LO1 **Research what aspects of User Experience and Interface Design are necessary and appropriate to satisfy end user emotions, desires and attitudes when using a user interface concept**

Identify formats, characteristics and appropriateness of UX and UI Design

Present an overview of UX and UI Design, how they are produced and their appropriate use in software development.

Identify what UX and UI Design is by researching the role, purpose, terminology and methodology of UX and UI Design.

Recognise the various forms of UX and UI Design by researching the history of, current trends and use in the product development lifecycle.

Recognise the use of appropriate UX and UI Design patterns.

Define the characteristics of UX and UI Designs by investigating how they can be used to satisfy end user emotions, desires and attitudes.

Recognise specific forms, patterns and trends of UX and UI Design:

Research, debate and agree current functionality, patterns and trends in UX and UI Design.

Identify various forms of UX and UI Design.

Define the advantages and disadvantages of using UX and UI Design.

Define standard tools available for use in UX and UI Design:

Identify standard tools available to create UX and UI Designs.

The advantages and disadvantages of UX and UI Design tools.

How UX and UI Design tools can be used to capture end user feedback.

Appropriateness of various tools for different end user testing outcomes.

LO2 Plan an appropriate User Experience map and Interface Design for a User Interface concept with a specific target end user in mind and also outline the tests you mean to conduct

Identify a specific end user and an appropriate UX and UI Design to test with this user type:

Choose a specific end user to conduct tests against.

Evaluate the benefits, features, advantages and disadvantages of different UX and UI Design methodologies for various end user testing outcomes.

Review different end user categorisations, classifications and behaviour modelling techniques.

Select the most appropriate form of UX and UI Design to achieve desired end user testing and outcomes.

Describe a plan to use appropriate UX and UI Design methodology and tools to conduct end user testing:

Apply end user classification and behaviour modelling to select an appropriate UX and UI Design methodology.

Outline the end user characteristics, desired testing criteria and results your UX and UI Design addresses.

Select an appropriate form of UX and UI Design necessary to achieve desired results.

Use your selected end user, appropriate UX and UI Design methodology and desired testing criteria to create a plan for a UI concept.

LO3 Build a User Interface concept and test it with users to see if it satisfies their emotions, desires and attitudes as planned

Utilise appropriate tools to develop a UX and UI Design:

Employ an appropriate set of tools to develop your plan into a UI.

Run end user experiments and examine feedback.

Reconcile and evaluate end user feedback and build a new iteration of your user interface modified with the most important feedback and enhancements.

Make multiple iterations of your user interface and modify each iteration with enhancements gathered from user feedback and experimentation.

LO4 Evaluate user feedback, test results and insights gained from end users interacting with your User Interface concept to determine success or failure and steps to improve in future versions

Asses the success of your UX and UI Design:

Assemble and appraise end use feedback from multiple iterations of your user interface.

Undertake a critical review and compare your final user interface and your test results with the original plan.

Evaluate the advantages, disadvantages, strengths and weaknesses of your UX and UI Design methodology.

Critique the overall success of your UI and discuss your UX insights.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Research what aspects of User Experience and Interface Design are necessary and appropriate to satisfy end user emotions, desires and attitudes when using a user interface concept</p>

Unit 41:

Analytic Architecture Design

Unit code	T/615/1687
Unit level	5
Credit value	15

Introduction

Aircraft, trains and other high-tech machines improve our quality of life – none of these could function without automatic systems. The ability to analyse and design an automatic system is a vital subject. Architecture Analysis & Design Language (AADL) is designed for the specification, analysis, automated integration and code generation of real-time performance-critical (timing, safety, schedulability, fault tolerant, security, etc.) distributed computer systems.

This unit introduces students to the AADL. It provides an introduction to the language and AADL specifications, which is defined in the Society of Automotive Engineers (SAE) standard. The SAE AADL standard provides formal modelling concepts for the description and analysis of application systems architecture in terms of distinct components and their interactions. Within the AADL, a component is characterised by its identity, possible interfaces with other components, distinguishing properties, subcomponents and their interactions. The AADL is a useful tool to model and analyse the existing systems, but also design and integrate new systems.

Among the topics included in this unit are: AADL overview, system models and specification, security, components (software components, execution platform components), structure and instantiation, mode and flow, and properties.

On successful completion of this unit students will be able to describe the abstractions that support the specification of component interactions; present the specification of alternative operational states of a system; describe the use of the AADL flows concept and present examples of the specification of abstract flows throughout a system; describe the constructs for organising an AADL specification. It includes examples of AADL architectural pattern sets.

As a result, they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Explore detailed and problem-oriented material and gain a conceptual overview of the AADL abstractions.
- LO2. Illustrate the software component and execution platform component abstractions, and provide example declarations for these components.
- LO3. Analyse the specification of composite systems and their instances, and describe the abstractions that support the specification of component interactions.
- LO4. Show the specification of alternative operational states of a system by AADL flow concepts, and describe modes mode transitions, and examples of specification.

Essential Content

LO1 **Explore detailed and problem-oriented material and gain a conceptual overview of the AADL abstractions**

AADL overview (concept, history, applications).

Abstractions:

Basic component of AADL, utilisation of AADL.

System models and specification:

Introduction to architectural analysis and AADL architecture.

LO2 **Illustrate the software component and execution platform component abstractions, and provide example declarations for these components**

Software components:

Introduction to the AADL software component, the way to describe data, subprogram and thread, different representations of software component.

Execution platform component:

Introduction to the AADL hardware component, the way to describe Processor, Memory, Bus and Device, different representations of software component.

LO3 **Analyse the specification of composite systems and their instances, and describe the abstractions that support the specification of component interactions**

System abstraction:

Textual and graphical representations of system.

System instance:

The way to create system instance and implementation.

Component interactions:

Introduction to the connection between interface elements, implement the port and the access in the system design.

Subcomponent:

Introduction to implementation of the subcomponents in system, and the access of data in difference subcomponents.

Software components:

Implementation of software components in system design.

Execution platform components:

Implementation of execution platform components in system design.

LO4 **Show the specification of alternative operational states of a system by AADL flow concepts, and describe modes mode transitions, and examples of specification**

Modes and Flow; Properties; Structure and Instantiation.

Model specifications:

Basic introduction to the modes and the representations of modes.

Model configurations:

Thread with control system, modes in calls sequences.

Flow declarations:

Introduction basic flow concept and element.

Flow paths:

Flow paths of different components in flow design, including secure features.

Property declarations:

Idea of property and declarations about the property.

System abstraction.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Explore detailed and problem-oriented material and gain a conceptual overview of the AADL abstractions</p>		<p>LO1 & LO2</p> <p>D1 Critically analyse components, physical design and logical elements.</p>
<p>P1 Interpret the basic concept of elements and the methods of AADL, and analyse an example using AADL.</p> <p>P2 List the advantages and disadvantages of using AADL.</p>	<p>M1 Design and build a system using AADL to realise a specific function.</p> <p>M2 Distinguish the different AADL representations.</p>	
<p>LO2 Illustrate the software component and execution platform component abstractions, and provide example declarations for these components</p>		
<p>P3 Present a software component using different representations.</p> <p>P4 Distinguish the software components and execution platform components in a system.</p>	<p>M3 Declare components under AADL specification.</p> <p>M4 Implement different components in a system.</p>

Unit 42:

Risk Analysis & Systems Testing

Unit code	F/615/1689
Unit level	5
Credit value	15

Introduction

Risk-based testing prioritises tests during the system testing phase based on the highest impact and probability of system failure.

The aim of this unit is to provide students with knowledge and skills to use risk-based testing (RBT) using a medium-sized application, developing a full and detailed RBT procedure and documenting the results. They will then be able to evaluate the effectiveness of the application and the testing procedures employed. RBT is used widely in industry to organise software testing and use test resources more efficiently.

This unit introduces students to prioritising testing software features according to risk of failure, evaluated as a function of criticality or importance and impact of failure. Risk of software failure determines the priority of tests within a Test Plan, strategically carrying out testing over multiple test cycles.

Among the topics included in this unit are: how to classify and evaluate software risks using the risk formula, risk matrix, RBT testing and test build strategies, priority test cycles, security testing, coverage analysis and risk reduction reports.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Examine risk-based testing and requirements.
- LO2. Create a customised risk-based test strategy, plans and techniques for a given specification.
- LO3. Demonstrate a risk-based Test Plan, producing associated outcomes.
- LO4. Evaluate a risk-based Test Plan and its associated outcomes.

Essential Content

LO1 Examine risk-based testing and requirements

Risk-based testing and requirements:

Stages: evaluate risk-based testing stage model (ISO/IEC 9126-1); define no risk/no test; distinguish risk classifications, business/operational, security, technical, external; apply risk formula $r(f) = P(f)*C(f)$; test risk assessment/criticality; develop risk weighted matrix; develop risk quality matrix; assess risk reduction methods; detail project risks; identify methods of reporting progress.

LO2 Create a customised risk-based test strategy, plans and techniques for a given specification

Risk-based test strategy, plan and techniques:

Test strategy: develop test risk matrix, selection of risk-based tests; develop risk test plan; build environment rollout plan development; implementation (black box or functional testing, white (or glass) box testing; sub-system, integration (use-case, whole system, interface); maintenance (following changes or reviews, after length of time, stress/overload); user evaluation (analysis of requirements, actual outcomes, acceptance, alpha, beta).

Test Plan: examine test cycles (prioritising security testing); example test data (normal, erroneous, extreme), define expected outcomes (valid, invalid, information gained), reporting of risk.

Techniques: apply black box or functional testing (e.g. control flow, data flow), white (or glass) box testing (e.g. boundary value, branch condition); validation, verification; analyse test coverage/follow up; fault density analysis.

LO3 Demonstrate a risk-based Test Plan, producing associated outcomes

Outcomes:

Review code coverage results and analysis; analyse cause defects; check fault density results; review actual results against expected results (valid information or action, invalid information or action; system-generated messages, program-generated messages).

Modifications:

Prioritisation of further test cycles; changes to specification, changes to analysis, design, amendments to code written, modifications to risk test strategy and plan; create risk reduction reports.

LO4 Evaluate a risk-based Test Plan and its associated outcomes

Evaluation:

Develop risk heuristics evaluation criteria (probability, severity, classification); identify risk-based testing benefits/drawbacks; define fit for purpose criteria; functionality, accuracy, security effectiveness; alterations to tests carried out, possible improvements; program specification and design, self-reflection, management aspects.

Maintainability:

Perform risk testing and reporting refinement; usefulness to self, usefulness to others.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Examine risk-based testing and requirements		LO1 & LO2 D1 Justify selection of test cases based on quantified risk to project.
P1 Investigate the testing stages involved in relation to a risk-based testing model. P2 Discuss the type of risks involved in systems testing in relation to the given specification.	M1 Determine three benefits in applying risk-based testing. M2 Present key information to be communicated post-risk-based testing.	
LO2 Create a customised risk-based test strategy, plans and techniques for a given specification		
P3 Establish a risk-based test strategy for the given specification, explaining specifically how security testing will be carried out. P4 Develop a full and detailed Test Plan relating to the risk-based test strategy.	M3 Create a test risk matrix showing how the risks were evaluated. M4 Design and apply a suitable risk-based test cycle.	

Pass	Merit	Distinction
<p>L03 Demonstrate a risk-based Test Plan, producing associated outcomes</p>		<p>D2 Assess the importance of a suitable build environment to support a risk-based test strategy.</p>
<p>P5 Perform the tests identified in the risk-based Test Plan.</p> <p>P6 Provide a detailed log of all test results.</p>	<p>M5 Discuss, with the aid of an example, how prioritisation of test cycles can improve testing.</p> <p>M6 Propose a strategy for designing and building a risk-based test environment.</p>	
<p>L04 Evaluate a risk-based Test Plan and its associated outcomes</p>		<p>D3 Examine how test risk heuristics are identified, evaluated and monitored in a risk based test strategy, providing justification.</p>
<p>P7 Discuss the reasons for all modifications made at each stage of the risk-based test procedure.</p> <p>P8 Evaluate the effectiveness of the risk based test strategy including an assessment of security testing cycles.</p>	<p>M7 Compare two risk-based test strategies and explain the benefits/disadvantages.</p>

Internet of Things

Unit code	T/615/1690
Unit level	5
Credit value	15

Introduction

The Internet of Things (IoT) is a network of physical objects – devices, vehicles, drones and other objects embedded with electronics, software, sensors and network connectivity that enables these objects to collect and exchange data. The objective of the IoT is to enable almost any object to become smart, accessible and data capable, thereby benefitting from advances in communications, computation and interconnectivity. IoT explores the mixture of hardware, software, data, platforms and services that can be combined to create innovative opportunities for more direct integration of the physical world and objects into computer-based systems, resulting in improved efficiency, accuracy, social and economic benefit to people.

This unit introduces students to the role, basic concepts and benefits of IoT in the design and development process of computer applications. The aim of the unit is to enhance the student's understanding of the methodology, terminology and benefits of IoT in the design and development of software applications.

Among the topics included in this unit are: classification and terminology of IoT, the hardware, software, data, platforms and services used to enable IoT, common architecture, frameworks, tools, hardware and APIs that can be utilised to design IoT-enabled objects, problems and solutions resulting from widespread deployment and adoption of IoT, software application methodology for IoT specific software application design and development, data models, network complexity, security, privacy, enabling technologies and how to simulate and test an IoT concept.

On successful completion of this unit students will be able to explain the basic concepts of IoT; design, build and simulate an IoT application using any combination of hardware, software, data, platforms and services; be able to discuss the problem IoT applications solves; the potential impact on society, business and the end user and the problems encountered when integrating into the wider IoT ecosystem.

As a result they will develop skills such as communication literacy, design thinking, team working, critical thinking, analysis, reasoning and interpretation, computer software literacy, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Analyse what aspects of IoT are necessary and appropriate when designing software applications.
- LO2. Outline a plan for an appropriate IoT application using common architecture, frameworks, tools, hardware and APIs.
- LO3. Develop an IoT application using any combination of hardware, software, data, platforms and services.
- LO4. Evaluate your IoT application and the problems it might encounter when integrating into the wider IoT ecosystem.

Essential Content

LO1 Analyse what aspects of IoT are necessary and appropriate when designing software applications

Identify role, formats and characteristics of IoT:

Present an overview of IoT and its appropriate use in software development.

Investigate what IoT is by researching its role, purpose, terminology and methodology.

Recognise the various forms of IoT by researching its history, current trends and use in relation to, and conjunction with, traditional computer-based systems and networks.

Define the characteristics of IoT by investigating how it can be used and how it can interact with existing computer-based networks and the physical world.

Recognise the use of appropriate IoT applications to solve specific problems.

Research specific forms of IoT functionality:

Explore various forms of IoT functionality.

Research, debate and agree current functionality, technology and trends for IoT.

Investigate the advantages and disadvantages of using IoT.

Define standard architecture, frameworks, tools, hardware and APIs available for use in IoT application development:

Review architecture, frameworks, tools, hardware and APIs available to develop IoT applications.

The advantages and disadvantages of IoT architecture, frameworks, tools, hardware and APIs.

How various architecture, frameworks, tools, hardware and APIs can be used to create IoT applications.

Appropriateness of various architecture, frameworks, tools, hardware and APIs for different problem-solving requirements.

LO2 Outline a plan for an appropriate IoT application using common architecture, frameworks, tools, hardware and APIs

Identify a problem to be solved and select appropriate IoT techniques to solve this problem:

Choose a specific problem to solve using IoT.

Evaluate the benefits, features, advantages and disadvantages of IoT to solve this problem.

Review different architecture, frameworks, tools, hardware and API techniques you could apply to solve this problem.

Select the most appropriate IoT architecture, frameworks, tools, hardware and API techniques to include in an application to solve this problem.

Describe a plan for an IoT application to solve this problem:

Outline the problem you intend to solve and how IoT and your application addresses this problem.

Select an appropriate IoT application to achieve desired results.

Apply IoT architecture, frameworks, tools, hardware and API techniques to solve this problem.

Use your selected techniques to create an IoT application development plan.

LO3 Develop an IoT application using any combination of hardware, software, data, platforms and services

Utilise appropriate tools and techniques to develop an IoT application:

Employ an appropriate set of tools to develop your plan into an IoT application.

Run end user experiments and examine feedback.

Reconcile and evaluate end user feedback and determine advantages and disadvantages of your chosen IoT techniques.

LO4 Evaluate your IoT application and the problems it might encounter when integrating into the wider IoT ecosystem

Assess the success of your IoT application:

Assemble and appraise end use feedback from your IoT application.

Undertake a critical review and compare your final application with the original plan.

Evaluate the advantages, disadvantages, strengths and weaknesses of your IoT techniques.

Critique the overall success of your application. Did it solve your problem? What is the potential impact on people, business, society and the end user? What problems might it encounter when integrating into the wider IoT ecosystem?

Discusses your insight using IoT.

Robotics

Unit code	F/615/1692
Unit level	5
Credit value	15

Introduction

Robots are becoming much more widely used, with applications ranging from agriculture through to manufacturing, including an increasing interest in autonomous systems. These are mechanical devices produced in various forms, including human form. Robots can move by themselves, and their motion can be modelled, planned, sensed, actuated and controlled by programming.

This unit is designed to explore robotic systems, both historically and as an area of rapid contemporary development. The student will be introduced to the different types and applications of robotic systems and will be encouraged to discuss and reflect on the implications of using robots

Topics included in this unit are an introduction to robotic systems, types of robots, industrial robots, automation system components, developing a solution, sensors, and sensor-based robots, ethical considerations, safety, social and economic impacts.

On successful completion of this unit, students will gain experience in building a robot and be exposed to a wide range of practical applications of robotic systems. As a result students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Explore different robotic systems commonly used in industry, taking into account different configurations and the advantages and disadvantages of these.
- LO2. Build a robot and appraise this from the perspectives of cost-benefit impact.
- LO3. Evaluate the operation and application of a range of sensors (e.g. vision, tactile) and how they can apply to a mobile or static robotic system.
- LO4. Evaluate the relevance of biologically inspired robotic systems and how these can benefit both the understanding of biological systems and the design of individual or groups of robots.

Essential Content

LO1 **Explore different robotic systems commonly used in industry, taking into account different configurations and the advantages and disadvantages of these**

Introduction to robotics:

Types and applications of robotics, why robots are important.

Industrial robotics:

Applications of robotics to industries, including medical, surgical and rehabilitation robotics.

Advantages and disadvantages, safety, security, social and economic impacts, and ethical issues of robots.

LO2 **Build a robot and appraise this from the perspectives of cost-benefit impact**

Components and instruction to build:

Classification of types of robot; identification of manipulator components and terminology; joints classification, compactor, digital millimeter, robot-line followings, battery, register, LEDs, DC motor, etc.

LO3 **Evaluate the operation and application of a range of sensors (e.g. vision, tactile) and how they can apply to a mobile or static robotic system**

Sensors:

Range of sensors, their components and compatibilities.

Tactile sensors:

Construction of tactile, and touch sensors, interpretation of sensory information, use of sensory data to determine kinematic information.

Vision systems:

Computer vision, perception, optical flow, road car and quad-copter navigation.

LO4 Evaluate the relevance of biologically inspired robotic systems and how these can benefit both the understanding of biological systems and the design of individual or groups of robots

Biologically inspired robotics:

Types of biologically inspired robotics, humanoid robots, bio-inspired morphologies, reactive and deliberative control, learning behaviours; multi-robot and swarm systems.

Reflection:

How does the robot help to understand biological systems? How do biological systems help to design a robot?

Learning Outcomes and Assessment Criteria

Unit 26: Machine Learning

Unit 27: Artificial Intelligence

Unit 45: Emerging Technologies

Unit code R/615/1695

Unit level 5

Credit value 15

Introduction

Emerging Technologies have the ability to disrupt industries, radically change the progress and thinking of humankind, affect society at large and solve huge problems. Computing underpins many Emerging Technologies and allows rapid development and sharing of ideas, products and scientific understanding to occur across multiple fields in shorter and shorter timeframes. The objective and effect of Emerging Technologies is usually to change the status quo. This change might be to solve problems, increase performance, improve efficiency, or create entirely new scientific fields and novel technologies by converging different systems, technology, thinking or disciplines together. Emerging Technologies explore a variety of changing technologies that display radical novelty, have the potential for significant commercial or social impact, fast growth, scalability and affect the future in uncertain ways.

This unit introduces students to the role, benefits, disadvantages and potential outcomes Emerging Technologies have in the development of software applications. The aim of the unit is to enhance the student's understanding of the current state, terminology, advantages, disadvantages, potential impact and benefits of Emerging Technologies on the development of software applications.

Among the topics included in this unit are: classification and terminology of Emerging Technologies, review the most promising and impactful Emerging Technologies, trends of convergence, the impact of computers in the development of Emerging Technologies, the hardware, software, data, platforms and services used to enable development of Emerging Technologies, understand the scale, scope, advantages and disadvantages Emerging Technologies may have on humankind.

On successful completion of this unit students will be able to explain some of the most promising and impactful Emerging Technologies. Have an awareness of the impact, advantages and disadvantages Emerging Technologies may have on humankind. Understand the impact Emerging Technologies will have on the development of software applications.

As a result they will develop skills such as communication literacy, design thinking, team working, critical thinking, analysis, reasoning, interpretation and computer software literacy, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Assess what Emerging Technologies are necessary and appropriate when designing software applications for the future.
- LO2. Research state-of-the-art Emerging Technologies and choose one you believe will have significant impact in the future.
- LO3. Discuss the current state and future impact of your chosen Emerging Technology.
- LO4. Evaluate the political, economic and social factors which play a role in the competition between Emerging Technologies and their success or failure in the future.

Essential Content

LO1 **Assess what Emerging Technologies are necessary and appropriate when designing software applications for the future**

Evaluate formats, characteristics and trends of Emerging Technologies:

Present an overview of Emerging Technologies and their appropriate use in software development.

Assess what Emerging Technology is by researching its role, purpose and terminology.

Recognise the various forms of Emerging Technology by researching its history and current trends.

Define the characteristics of Emerging Technology by investigating how they can be used and how they differ from and converge with developed technology.

Recognise specific Emerging Technologies:

Research, debate and agree current trends in Emerging Technology.

Assess various forms of Emerging Technology, focusing on their relevance to software development and computing.

Define the advantages and disadvantages of Emerging Technology.

How Emerging Technologies can converge with existing technologies or replace them.

Appropriateness of using of Emerging Technology to disrupt the status quo throughout industries, markets, user adoption and established practices.

LO2 **Research state-of-the-art Emerging Technologies and choose one you believe will have significant impact in the future**

Investigate a specific Emerging Technology and how it will affect the status quo of an industry, end user group and the current state of technology development:

Investigate a specific Emerging Technology for discussion choosing one you believe will have the most impact to software application design and development in the future.

Choose a specific industry and end user group that will be the most influenced by this Emerging Technology.

Evaluate the benefits, features, advantages and disadvantages of this Emerging Technology.

LO3 Discuss the current state and future impact of your chosen Emerging Technology

Develop a report and presentation using research gathered about your chosen Emerging Technology, industry and end user:

Organise your research and findings.

Contrast the benefits, features, advantages and disadvantages of your chosen Emerging Technology.

Relate how your chosen Emerging Technologies can converge with existing technologies or replace them.

Defend your choice of Emerging Technology in relation to your belief it will have the most impact on software application design and development in the future.

Develop a report of your research and findings.

LO4 Evaluate the political, economic and social factors which play a role in the competition between Emerging Technologies and their success or failure in the future

Assess the success of your research:

Arrange a presentation to demonstrate your findings, gather feedback and answer questions.

Assemble and appraise your report findings and research.

Evaluate the political, economic and social factors which play a role in the competition between Emerging Technologies and their success or failure in the future.

Discuss how your chosen Emerging Technologies can converge with existing technologies or replace them.

Virtual & Augmented Reality Development

Unit code Y/615/1696

Unit level 5

Credit value 15

Introduction

Virtual (VR) and Augmented (AR) Reality is the process by which you can use computer software and hardware technologies to develop fully immersive, simulated virtual reality environments or augment the real world with virtual reality content. The objective of Virtual and Augmented Reality development is to design virtual environments or real world augmentations for numerous beneficial, experimental, educational or entertainment purposes. VR and AR explores the potential to work, interact, play, collaborate and communicate in expansive simulated environments or use technology to enhance the real world with some of the benefits and features of simulated virtual environments.

This unit introduces students to the role, basic concepts and benefits of VR and AR technology and how to apply them in the development of VR/AR computer applications. The aim of the unit is to enhance the student's understanding of the methodology, terminology and benefits of VR and AR software applications.

Among the topics included in this unit are: classification and terminology of VR and AR technology, the relationship between VR and AR design, how VR and AR development relates to and differs from other forms of software development, modes of interaction, human-computer interaction models, usability, accessibility, aesthetics, spatial design, 3D vision, motion tracking, understand the hardware, software, data, platforms and services available to develop VR and AR software applications.

On successful completion of this unit students will be able to explain the basic concepts of VR and AR development. Plan, build and measure the success of an appropriate VR or AR software application. Design a VR or AR software application. As a result they will develop skills such as communication, literacy, design thinking, team working, critical thinking, analysis, reasoning, interpretation and computer software literacy, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Examine what aspects of VR and AR technology are necessary and appropriate when designing VR and AR software applications.
- LO2. Plan an appropriate VR or AR software application using common architecture, frameworks, tools, hardware and APIs.
- LO3. Design, build and simulate a VR or AR software application using any combination of hardware, software, data, platforms and services.
- LO4. Evaluate your VR or AR software application and detail the problems and limitations your application encountered and the reaction your VR or AR application generated with end users.

Essential Content

LO1 **Examine what aspects of VR and AR technology are necessary and appropriate when designing VR and AR software applications**

Identify formats, characteristics and aspects of VR/AR technology:

Present an overview of VR/AR technology and its appropriate use in software development.

Identify what AR/VR is by researching the role, purpose, terminology and methodology of this technology.

Recognise the various forms of AR/VR technology by researching its history, current trends and use in the product development lifecycle.

Define the characteristics of AR/VR by investigating how it is similar to and differs from traditional simulated and virtual environments.

Recognise specific forms of AR/VR technology:

Research, debate and agree current functionality and capabilities of AR/VR technology.

Identify various forms of AR/VR technology and end user hardware.

Identify architecture, frameworks, tools, hardware and APIs available to develop applications.

Define the advantages and disadvantages of AR/VR technology.

Define standard tools available for use in developing AR/VR applications:

Identify standard tools available to develop AR/VR applications.

The advantages and disadvantages of AR/VR tools and hardware.

Appropriateness of various tools to develop AR and VR applications.

LO2 **Plan an appropriate VR or AR software application using common architecture, frameworks, tools, hardware and APIs**

Identify an application concept to develop in AR/VR:

Evaluate the benefits, features, advantages and disadvantages of AR/VR technology to develop this application.

Review different AR/VR architecture, frameworks, tools, hardware and API techniques you could apply to develop this application.

Select the most appropriate AR/VR architecture, frameworks, tools, hardware and API techniques to include in this application.

Describe a plan to develop your AR/VR application concept:

Use your selected techniques to create an AR/VR application development plan.

LO3 Design, build and simulate a VR or AR software application using any combination of hardware, software, data, platforms and services

Utilise appropriate tools and techniques to develop an AR/VR application:

Employ an appropriate set of tools to develop your plan into an AR/VR application.

Run end user experiments and examine feedback.

Reconcile and evaluate end user feedback and determine advantages and disadvantages of your chosen AR/VR techniques.

LO4 Evaluate your VR or AR software application and detail the problems and limitations your application encountered and the reaction your VR or AR application generated with end users

Assemble and appraise end use feedback from your AR/VR application:

Undertake a critical review and compare your final application with the original plan.

Evaluate the advantages, disadvantages, strengths and weaknesses of your AR/VR techniques.

Critique the overall success of your application. Was it successful? How did users react to it?

Discusses your insight using AR/VR Technology.

Games Development

Unit code	D/615/1697
Unit level	5
Credit value	15

Introduction

In the field of computing, games development is a multidisciplinary art form that creates worlds that blend player psychology, problem-solving and artificial intelligence with knowledge about dedicated hardware and software platforms. This level of ability can often require significant effort on the part of the student with regards to time and practice. However, as more experience is gained, the skills and abilities quickly improve. In addition, once completed it is important to know that the capabilities and flexibility of a good games developer can easily be transferred to other roles in the business sector.

This unit introduces students to games development and is designed to simulate the roles and responsibilities of a games developer working in a suitable games development studio with access to a small team of colleagues. Students are expected to discuss and review a number of original game ideas before synthesising them into a single game concept. Once defined they will need to adopt and use appropriate methods and practices to analyse, breakdown and discuss the issues – then, decide, design, create and test a functional game. Students should be free to debate, evaluate and select different design and development methodologies depending on their own judgement and consideration. On completion, and in addition to the student reviewing and reflecting on the experience, they will be expected to formally evaluate their completed game against their Games Design Document and original concept.

Among the topics included in this unit are: game design and developer documentation, problem analysis, research, system and user requirements, design methodologies and principles, development methodologies, unified modelling language (UML), software development lifecycles, games engines, hardware platforms, graphic manipulation, physics, maths for games, sound, networking, collision detection, teamwork, peer-reviews, development tools and techniques, integrated development environments, debugging, testing, software versions and quality assurance.

On successful completion of this unit students will be able to develop a Game Design Document by evaluating and synthesising game ideas into an original video game concept, select and use different design and development methodologies with tools and techniques associated with the creation of a video game, work individually and as part of a team to plan, prepare and produce a functional video game including support documentation, assess and plan improvements to a video game by evaluating its performance against its Game Design Document and original concept.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Develop a Game Design Document by evaluating and synthesising game ideas into an original video game concept.
- LO2. Use different design and development methodologies with tools and techniques associated with the creation of a video game.
- LO3. Work individually and as part of a team to plan and produce a functional video game, including support documentation.
- LO4. Evaluate the performance of a video game against its Game Design Document and original concept.

Essential Content

LO1 **Develop a Game Design Document by evaluating and synthesising game ideas into an original video game concept**

Research and compare different game genres and ideas:

Discuss and compare common game elements such as: type, story, characters, environment, levels, gameplay, loops, art, sound, user interface and controls.

Determine possible game ideas and predict the overall success of fully developing your game.

Develop a Game Design Document:

Review and discuss the value of Game Design Documents with regards to games development.

Evaluate and synthesise your game ideas into a single document that describes (in detail) your game concept.

Research and use information relating to games testing to create a suitable test plan for your game.

LO2 **Use different design and development methodologies with tools and techniques associated with the creation of a video game**

Discuss different design and development methodologies:

Present overviews on current design and development methodologies.

Debate various strengths and weaknesses commonly associated with each methodology.

Select or synthesise a design and development methodology for use with the creation of your video game.

Use appropriate tools and techniques:

Evaluate different tools and techniques available to create a video game.

Establish your development plan by debating the advantages and disadvantages of your preferred or selected tools and techniques.

LO3 Work individually and as part of a team to plan and produce a functional video game, including support documentation

Work as a small team to plan and prepare your functional video game:

Peer-review and debate your development plan and Games Design Document by effectively communicating and defending your ideas and reasoning.

Discuss differences with regards to the possible strengths and weakness of each Game Design Document and development plan.

Modify your design document or plans to reflect any new insights or considerations.

Prepare and produce a functional video game:

Use your Game Design Document with your development plan to produce a functional video game.

Create and quality check appropriate support documents for your video game.

LO4 Evaluate the performance of a video game against its Game Design Document and original concept

Assess the performance of a video game:

Analyse factors that influence the performance of a video game with regard to its system requirements.

Undertake a critical review of the performance and development of your video game against all identified factors and any adopted design and development methodologies.

Measure the overall success of the video game against your original prediction and identify any new areas of personal insight.

Plan improvements to a video game:

Evaluate the overall strengths and weaknesses of your video game against its Game Design Document and original concept.

Discuss and plan in detail possible revisions (including implementation) with regard to improving your video game's performance.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Develop a Game Design Document by evaluating and synthesising game ideas into an original video game concept</p>		<p>D1 Evaluate common game design elements and justify their use when designing a suitable Game Design Document.</p>
<p>P1 Explore different game-based ideas, blending them into an original video game concept.</p> <p>P2 Examine any areas of risk related to the successful completion of your video game.</p>	<p>M1 Analyse and combine common game design elements (such as type, story, characters, environment, levels, gameplay, loops, art, sound, user interface and controls) with your original video game concept to create a suitable Game Design Document.</p>	

Pass	Merit	Distinction
LO2 Use different design and development methodologies with tools and techniques associated with the creation of a video game		
P3 Research the use of different design and development methodologies, tools and techniques and determine which have been selected for the development of this video game.	M2 Compare the differences between the various design and development methodologies, tools and techniques researched and justify your preferred selection.	LO2 & LO3 D2 Evaluate any new insights, ideas or potential improvements to your concept, methodology or use of tools and justify the reasons why you have chosen to include (or not to include) them as part of this development.
LO3 Work individually and as part of a team to plan and produce a functional video game, including support documentation		
P4 Create a formal presentation that effectively reviews your video game concept together with your preferred design and development methodologies and selected tools and techniques. Use this presentation as part of a peer-review and document any feedback given. P5 Develop a functional video game based on a specified game concept.	M3 Interpret your peer-review feedback and identify opportunities not previously considered. M4 Develop a functional video game based on a specific Game Design Document with supportive evidence of using the preferred design and development methodologies and selected tools and techniques.	
LO4 Evaluate the performance of a video game against its Game Design Document and original concept		
P6 Evaluate the performance of your video game against your original concept.	M5 Critically analyse the factors that influence the performance of a video game and use them to undertake a critical review of the design, development, game elements and testing stages of your video game. Conclude your review by reflectively discussing your previously identified risks.	D3 Critically evaluate the strengths and weaknesses of your video game and fully justify opportunities for improvement and further development.

Systems Integration

Unit code	H/615/1698
Unit level	5
Credit value	15

Introduction

Large organisations and businesses are composed of different functional areas, such as finance, HR, customer management, engineering services, product manufacturing, storage and warehousing. These functional areas carry out different operations in order to fulfil the goals of the business and often use a variety of different IT systems (e.g. stock control, accounts, HR, etc.) from a range of different suppliers and vendors to service their needs. The success of any large business or enterprise in achieving its goals depends on the ability of IT systems to effectively communicate with each other. However, IT systems from different vendors or suppliers often use different hardware and/or software platforms and services, thus creating the need for systems integration.

This unit introduces students to enterprise business requirements, and the need and purpose of systems integration to support organisational goals. Students are expected to gather and review business objectives with the aim of developing a systems specification document. As part of a feasibility analysis, students are expected to evaluate factors and issues affecting the successful completion of integration, including describing and documenting the functional architecture and design of a system. Students are also expected to explore hardware and software technologies used to connect systems and subsystems and establish an integration methodology to design and implement an integrated solution. In addition, students will investigate and compare different cloud service models and evaluate different deployment methods and consider their effect on systems integration.

Among the topics included in this unit are: enterprise business objectives, purpose and operation of systems integration, systems specification documents, feasibility analysis, risk assessments, architectural development, hardware and software technologies for systems integration, operational configuration, systems integration design framework, design, development and deployment of a systems integration solution, quality assurance, cloud services as a systems integration provision, cloud service models and different deployment models, such as private and public cloud services.

On successful completion of this unit students will be able to analyse systems integration requirements with regard to business objectives, investigate different hardware and software systems with regard to connectivity, communication and data transfer, prepare a suitable integrated solution based on a set of business requirements and compare a range of cloud computing providers and evaluate their services.

As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Analyse systems integration requirements with regards to business objectives.
- LO2. Investigate different hardware and software systems with regards to connectivity, communication and data transfer.
- LO3. Prepare a suitable integrated solution based on a set of business requirements.
- LO4. Compare a range of cloud computing providers and evaluate their services.

Essential Content

LO1 **Analyse systems integration requirements with regards to business objectives**

Identifying business objectives:

Introduce and outline the purpose and operation of 'systems integration'.

Gathering and reviewing business objectives, including interpreting business needs from different functional areas and departments.

Developing a systems specification document, including establishing and ensuring requirements can be met.

Feasibility analysis:

Using risk assessments to evaluate issues threatening the successful completion of integrating systems, including identifying any reasonable steps necessary to prevent or mitigate issues.

Architectural development; describe and document the functional architecture and design of the system and specify all technical requirements and capabilities.

LO2 **Investigate different hardware and software systems with regards to connectivity, communication and data transfer**

Exploring hardware and software technologies:

Research and evaluate hardware and software servers, technologies, platforms and services.

Connecting systems and subsystems, including custom software services and development.

Establish a systems integration methodology:

Operational configuration: exploring requirements, information needs and facilitating data transfer and communication.

Identifying and tracking issues for problem resolution and fault detection, including diagnosing type and location.

Implementing a design framework: using top-down and bottom-up methodologies.

LO3 Prepare a suitable integrated solution based on a set of business requirements

Establishing a strategic approach:

Analyse functional architecture and technical capabilities against a specification document to determine the probability of successfully developing (and deploying) an effective integrated solution.

Establishing a management strategy.

System design, development and deployment:

Designing, developing and monitoring an integrated system.

Quality Assurance, including deploying and testing an integrated system.

Evaluating system functionality: documentation, maintenance and upgrades.

LO4 Compare a range of cloud computing providers and evaluate their services

Investigating and comparing cloud service models:

Introduce and discuss IaaS (Infrastructure as a Service).

Review and debate PaaS (Platform as a Service).

Research and discuss: SaaS (Software as a Service).

Investigating and comparing deployment models:

Research and discuss private, public and hybrid clouds.

Evaluating issues: security, privacy and constraints.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
<p>LO1 Analyse systems integration requirements with regards to business objectives</p>		<p>LO1 & LO2</p> <p>D1 Critically evaluate your detailed 'System Specification' and 'Risk Assessment' document, including justification on how each of the specified business objectives has been met.</p>
<p>P1 Discuss the objectives and effect of 'Systems Integration' with regards to business operations and management.</p> <p>P2 Prepare a suitable 'Systems Specification' and 'Risk Assessment' document for a set of specific business objectives.</p>	<p>M1 Evaluate the processes involved in 'System Integration' and review the purpose and impact of assessing risk.</p> <p>M2 Provide a detailed 'Systems Specification' and 'Risk Assessment' document.</p>	
<p>LO2 Investigate different hardware and software systems with regards to connectivity, communication and data transfer</p>		
<p>P3 Discuss a range of hardware and software systems, technologies, platforms and services that would be suitable for use with a given 'Systems Specification' document.</p> <p>P4 Determine the purpose of top-down and bottom-up methodologies and how they relate to 'Systems Integration'.</p>	<p>M3 Provide a detailed and evaluated review of your selected systems, platforms, technologies and services and include details on system and service connectivity.</p>	

Pass	Merit	Distinction
<p>LO3 Prepare a suitable integrated solution based on a set of business requirements</p>		<p>LO3 & LO4</p> <p>D2 Critically evaluate the impact of cloud services on 'Systems Integration' and discuss the implications of 'IaaS, 'PaaS' and 'SaaS' and how they could be used to help organisations improve their performance.</p>
<p>P5 Create an 'Integrated Systems' solution to a set of specific business objectives using existing 'Systems Specification and Risk Assessment' documents, including illustrated design diagrams and details on information flow.</p> <p>P6 Create a systems deployment and test plan suitable for use with your 'Integrated Systems' solution.</p>	<p>M4 Provide a detailed and evaluated 'Integrated Systems' solution, including fully annotated diagrams, details on information flow, risk, redundant systems, backups, security, connectivity, deployment, testing and a full review of the solution's functionality compared to the 'Systems Specification' document.</p>	
<p>LO4 Compare a range of cloud computing providers and evaluate their services.</p>		
<p>P7 Discuss the differences between 'IaaS, 'PaaS' and 'SaaS' services and compare the 'private', 'public' and 'hybrid' deployment models offered by cloud computing providers.</p>	<p>M5 Review a range of cloud computing providers and compare the services offered.</p>

Unit level 5

Credit value 15

Introduction

Although many computer users do not interact directly with systems software and hardware, it is important that computing students have the opportunity to learn about these underlying systems.

MS-DOS, Windows, UNIX, Linux, Android, OS2, MacOS are just a few examples of different types of both modern and legacy Operating Systems. The foundations of most, if not all of them, is MS-DOS (Microsoft Disk Operating System). Way back in the 1980s this was used as the first Operating System for Personal Computers (PCs). In the 1990s, MS-DOS was transformed to a GUI (Graphic User Interface) WSWIG (What You See Is What You Get) Operating System through the release of Windows 3.11/Windows for Workgroups. That has led to several iterations of the Windows Operating System.

This unit introduces students to different operating systems such as DOS, Windows, UNIX and Linux. The topics covered are the tasks of operating systems such as controlling and allocating memory, prioritising system requests, controlling input and output devices, facilitating data networking and managing files, including security and protection.

Among the topics included in this unit are: the history and evolution of Operating Systems; the definition of an Operating System; why Operating Systems are needed; how Operating Systems started and developed; Operating Systems management roles; management of memory, processes, processors, devices and files; security and protection: user security, device, application and process protection; inter-process communication; comparison of Operating Systems; distributed and networked systems; concurrent systems; multi-user systems; graphical interface systems; and practical application of Operating Systems: user interface commands of major Operating Systems; installations and extensions of Operating Systems.

On successful completion of this unit students will be able to competently operate any given Operating System and undertake routine maintenance of Operating System as well as their optimisation. As a result they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1. Investigate different Operating Systems, their functions and user interfaces.
- LO2. Explore the processes managed by an Operating System.
- LO3. Demonstrate the use of DOS, Windows, UNIX and Linux.
- LO4. Analyse appropriate techniques and technologies used in distributed and concurrent systems.

Essential Content

LO1 Investigate different Operating Systems, their functions and user interfaces

The history of Operating Systems:

Discuss the history of Operating Systems from Legacy Operating Systems to current Operating Systems, tracking its development from Batch files to the modern Operating Systems.

History and evolution of operating systems:

Discuss what is meant by an Operating System; why do we need Operating Systems? How did Operating Systems start and develop throughout the ages? What constitutes an Operating System?

LO2 Explore the processes managed by an Operating System

Operating Systems Management:

Discuss in detail how Memory Management is conducted in an Operating System.

Discuss how job scheduling is handled by an Operating System. Discuss how Process Scheduling happens in in Operating Systems. How does concurrent processing happen in an Operating System. Discuss how device management is accomplished by an Operating System. File Management is a crucial element for an Operating System, discuss how this is performed by an Operating System.

LO3 Demonstrate the use of DOS, Windows, UNIX and Linux

Commands for manipulating:

Interaction with different Operating Systems requires knowledge of certain commands and knowledge of manipulating them. You are required to research several MS-DOS, Windows, UNIX and Linux commands.

Consider how secure different Operating Systems are. In addition, also make reference to different environments and the conditions of use.

LO4 Analyse appropriate techniques and technologies used in distributed and concurrent systems

Critical evaluation of an Operating System environment:

Operating Systems can be used for a number of domains. Your task is to evaluate different Operating Systems' environments, including Distributed Operating Systems as well as Concurrent Operating Systems, etc.

Learning Outcomes and Assessment Criteria

Pass		Merit	Distinction
LO1 Investigate different Operating Systems, their functions and user interfaces			LO1, LO2 & LO3 D1 Critically evaluate the functionality, interface design and processes of a range of operating systems.
P1 Explore what an Operating System is.	M1 Discuss the importance of Operating Systems.		
P2 Research the evolution of Operating Systems.			
LO2 Explore the processes managed by an Operating System			
P3 Research the process of Memory Management in an Operating System.	M2 Analyse, with the aid of a diagram, the importance of Resource Management in an Operating System to aid its efficiency.		
P4 Investigate the process of job scheduling.			
LO3 Demonstrate the use of DOS, Windows, UNIX and Linux			
P5 With an aid of screenshots, prove the use of MS-DOS and Windows.	M3 Justify the security of each operating system discussed in P5 and P6.		
P6 With an aid of screenshots, prove the use of UNIX and Linux and MacOS.			
LO4 Analyse appropriate techniques and technologies used in distributed and concurrent systems			
P7 Discuss distributed Operating Systems.	M4 Justify which techniques and technologies you would use in a Distributed Operating system.	D2 Critically evaluate your work and make some recommendations about current Operating Systems and future advancements.	
P8 Discuss Concurrent Operating Systems.
